Document Change History			
Date	**Version**	**Changed by**	**Description**
01.11.2011	2.1.0	AUTOSAR Administration	• Simplification of use case diagrams by removing task use and introducing deliverables on use cases level (see Methodology Concept chapter) • Readability improvement by generation of tables with navigable links • Introduction of Variant Handling, E2E support, System Constraints Description • Refinement of Methodology Library, including the extension of deliverables in different use cases

01.11.2010	2.0.0	AUTOSAR Administration	• Changed tool platform for the SPEM model • Publish as pdf file instead of html • Used new table format for the model elements • Added SPEM diagrams • Methodology Concept chapter detailed • Memory Mapping use case added • Reworked and restructured use cases for more readability • Direct references to meta-model elements in figures and tables
23.06.2008	1.2.1	AUTOSAR Administration	• Legal Disclaimer revised
28.11.2007	1.2.0	AUTOSAR Administration	• Subchapter limitations of the current version enhanced • Document meta information extended • Small layout adaptations made
31.01.2007	1.1.0	AUTOSAR Administration	• Updated chapter 5 "ECU-Design • Updated chapter 6.1 Relationship with Services • Legal disclaimer revised • Release Notes added • Advice for users revised • Revision Information added
27.04.2006	1.0.0	AUTOSAR Administration	• Initial release

Disclaimer

Advice for users

AUTOSAR specifications may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the specifications for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such specifications, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction

1.1 Objective

AUTOSAR requires a common technical approach for some steps of system development. This approach is called the `AUTOSAR methodology`. This document defines and describes this `AUTOSAR methodology`. It covers all major steps of the development of a system with AUTOSAR: from the definition of the `Virtual Function Bus` to the generation of an `ECU executable`.

The requirements for the methodology are defined in the document [1].

1.2 Overview

The `AUTOSAR methodology` is structured into several domains of development:

- `Virtual Function Bus`
- `System`
- `Software Component`
- `Basic Software`
- `ECU`

For each domain, relevant `Work Product`, `Task`, `Role`, and `Tool` elements are defined (see chapter 3). In addition, there are elements that are common for all domains (see 3.1).

Use cases (see chapter 2) show how these standard reusable elements are applied to support real-world development. The Overall View (see chapter 2.1) provides an end to end view on the typical use cases of all domains.

1.3 Known Limitations

Work products and tasks for End to End communication safety are not completely described in the methodology.

1.4 Scope

The `AUTOSAR methodology` is not a complete process description, but rather aggregates the various elements of AUTOSAR and shows how they are brought together to develop a complete system. Sample aggregations are provided as Use Cases in

Chapter 2. The structure of the methodology was designed to help cover the needs of various AUTOSAR stakeholders:

- Organizations: Methodology is modeled in a modular format to allow organizations to tailor it and combine the Methodology within their own internal processes, while identifying points where they interact with other organizations.
- Engineers: Methodology is scoped to allow engineers of various roles quickly find AUTOSAR information that is relevant to their specific needs.
- Tool Vendors: Methodology provides a common language to share among all AUTOSAR members and a common expectation of what capabilities tools should support.

Furthermore, the methodology does not prescribe a precise order in which activities should be carried out. The methodology is a mere work-product flow: it defines the dependencies of activities on work-products. This means that when the information specified in the methodology is available, an activity can be carried out to produce the output work-products. The set of activities is described in Chapter 3.

This restriction implies that the AUTOSAR methodology does not define an overall time-line and does not define how and when iterations are carried out. For example during system and design, the same activity (namely configuring the system) will be carried out repeatedly with various levels of precision. There will be a first ”rough” configuration and a final ”precise” configuration which might depend on the feedback from the actual configuration or even implementation of ECUs. How and when such refinement steps are to be carried out is NOT defined in the methodology.

1.5 Methodology Concepts

The `AUTOSAR Methodology` defines activities performed by roles that create work products as general reusable method patterns. The reusable method pattern elements are described in the method library section (cf. Section 1.5.1). The methodology also describes sample process patterns of typical use cases considered for the creation of AUTOSAR work products. The patterns use process elements that are described in the use case section (cf. Section 1.5.2).

The definitions and the figures are made according to the Software Process Engineering Metamodel Specification [2]. The symbols are taken from the Enterprise Architect modeling tool.

1.5.1 Method Library (Method Content)

The `Method Library` defines the `Method Library Elements` of every *method pattern* such as `Roles`, `Tasks`, and `Work Product Definitions`. A `Method Library Element` contains a description of the element to define its purpose in the methodology and thus provides the basic contents of the AUTOSAR methodology. The Method Library Elements are used for the description of the related development processes. The Method Library and the Method Library Elements correspond to the Method Content and Method Content Elements in the SPEM meta model [2].

These Method Library Elements can been seen as a standard see AR_MET_REQ017 in [1].

Method Library Elements comprise:

- Task Definition
- Work Product Definition
- Role Definition
- Tool Definition
- Guidance

The element symbols are shown in Figure 1.1.

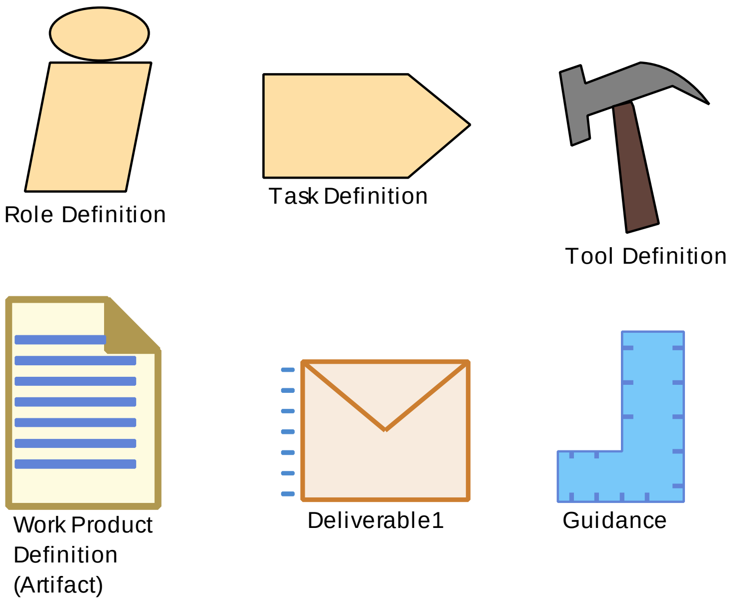

Figure 1.1: Symbols of AUTOSAR Method Content Elements

1.5.1.1 Task Definition

According to the SPEM meta model, a Task Definition is an assignable unit of work that is being performed by specific Roles. The duration of a task is generally a few hours to a few days. Tasks usually generate one or more work products. Each Task is associated to input and output Work Products. Inputs are differentiated in *mandatory* and *optional* inputs. A Task is used as one element among others to define a Process.

A Task has a clear purpose in which the performing roles achieve a well defined goal. It provides complete step-by-step explanations of doing all the work that needs to be done to achieve this goal. This description is completely independent of when in a process lifecycle the work would actually be done. It does not describe when what work is being done, but describes all the work that gets done.

When a Task is used in a process (cf. Task Use), it provides the information of which pieces of the Task will actually be performed at any particular point in time. This assumes that the Task will be performed in the process over and over again, but each time with a slightly different emphasis on different steps or aspects of the task description [2].

For the AUTOSAR Methodology, a Task is a reusable element that is used across multiple methodology use cases. A Task is associated to at least one performing Role and may have several additional performers. Tasks use Tools to achieve their outputs. Optional performers and optional input and outputs to the task are described by the relationship's multiplicity. An overview of the Task as it is used in this document is given in Figure 1.2.

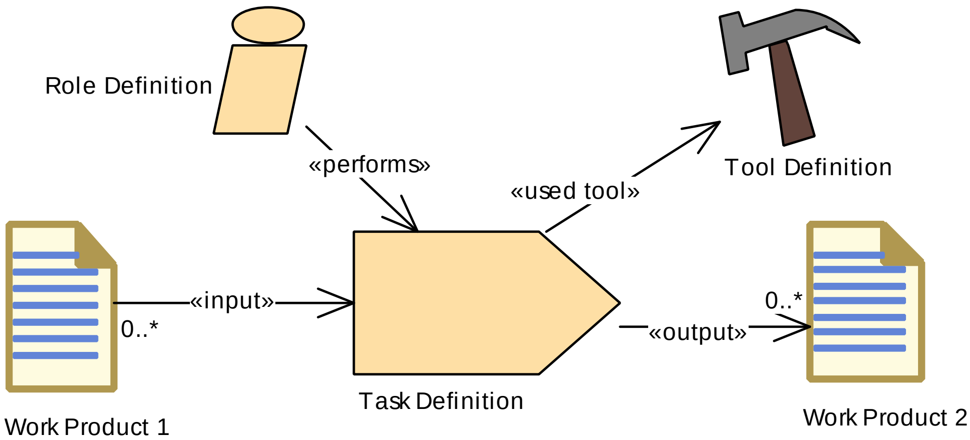

Figure 1.2: Task Definition Overview

1.5.1.2 Work Product Definition

According to the SPEM meta model, a Work Product Definition is used, modified, and produced by Tasks (i.e. a task input and output). Work Products are in most cases tangible work products consumed, produced, or modified by Tasks. They may serve as a basis for defining reusable assets. A Work Product can be related to other work products by a kind of nesting relationship.

Roles use Work Products to perform Tasks and produce Work Products in the course of performing the Tasks. Work Products are in the responsibility of the associated Roles, thereby also defining a set of skills the performing Role shoud have. Even though one Role might own a specific type of Work Product, other Roles can still use the Work Product for their work, and update them [2].

A Work Product can be of type

- Artifact: A tangible Work Product that is consumed, produced, or modified by one or more Tasks. Artifacts may be composed of other Artifacts and may serve as a basis for defining reusable assets [2].

  For the AUTOSAR Methodology, typical kinds of artifacts are:

  - AUTOSAR XML
  - source code
  - binary code (executable)
  - text

  At a high level, an artifact is represented as a single conceptual file. As a rule of thumb, the AUTOSAR Methodology will use artifacts that have most of the following properties:

  - Separate versioning is needed
  - A dedicated life cycle has to be cared for
  - Different exchange requirements need to be fulfilled
  - Change in responsible roles
  - Change in multiplicities
  - Change is physical representation or format
  - One of the products may be a separate deliverable to another party
  - Separation of standardized from non-standardized parts

  To express a relationship between artifacts of the methodology model and any AUTOSAR metamodel element, a relationship with the stereotype «atpUseMetaModelElement» is used to express this ”dependency”. For AUTOSAR metamodel elements that are not directly related to methodology elements, there is usually an indirect relationship via a related metamodel element. The methodology can thus focus on the main elements of the metamodel.

1.5.1.2.1 Deliverable

- Deliverable: Used to pre-define typical or recommended content in the form of Work Products that would be packaged for delivery. Deliverables are used to represent an output from a process that has value, material or otherwise, to a client, customer, or other stakeholder. A Deliverable is a Work Product that aggregates other Work Products. The Method Content maintains preconfigured potential Deliverables [2].

For the AUTOSAR Methodology, the aggregation relationship is used to indicate which `Work Products` are contained in a deliverable.

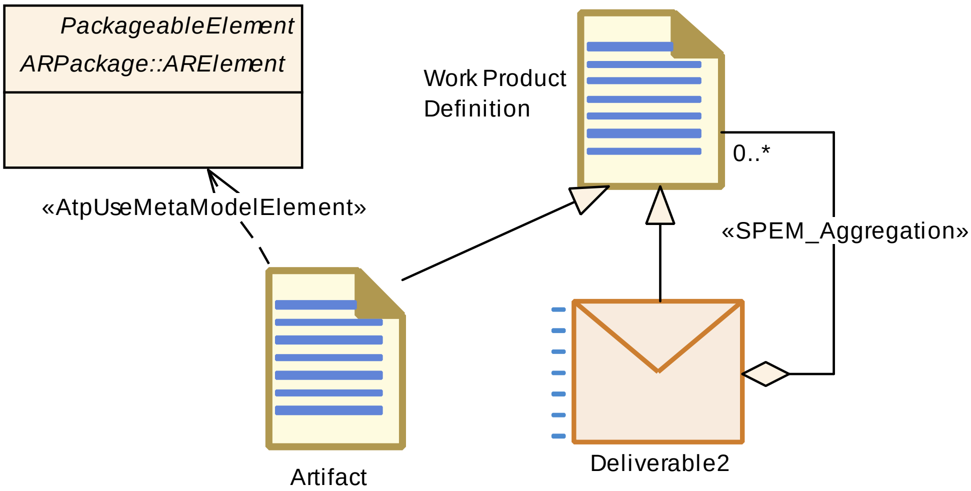

Figure 1.3: Work Product Definition Overview

1.5.1.3 Role Definition

According to the SPEM meta model, `Role Definitions` define responsibilities of an individual or a set of individuals and thereby define a set of related skills, competencies, and qualifications needed to perform a `Task`. A `Role` can be filled by one person or multiple people, one person may fill several `Roles`. Each `Role` performs `Tasks`.

`Roles` are not individuals or resources. Individual members of the development organization will wear different hats, or perform different `Roles`. The mapping from individual to `Role`, usually performed by the project manager when planning and staffing a project, allows different individuals to act as several different `Roles`, and for a `Role` to be taken by several individuals [2].

In the AUTOSAR Methodology, a `Role` also assigns the responsibility of a `Task` and defines *optional* performers. Performers that are responsible for e.g. a `Task` have a multiplicity of `1` for the relationship to the `Task`, optional performers have optional multiplicity assigned. `Role Definitions` are usually generic and still provide sufficient level of detail for managers to organize a team. Examples of `Roles` are ”System Engieer”, ”Safety Engineer”, or ”Software Developer”.

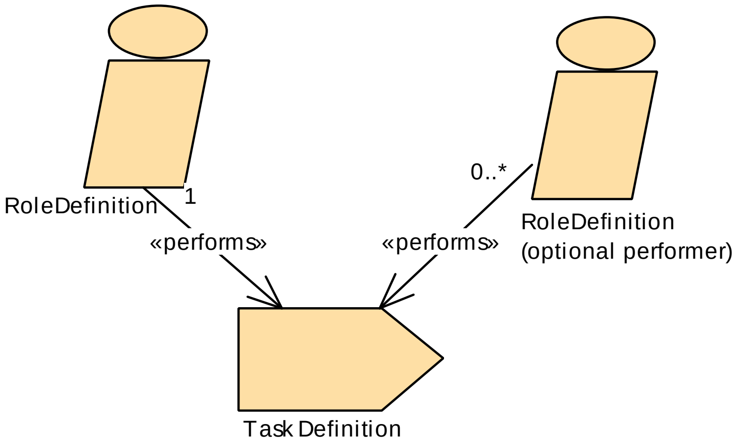

Figure 1.4: Role Definition Overview

1.5.1.4 Tool Definition

According to the SPEM meta model, `Tool Definitions` can be used to specify a tool's participation in a `Task`. A `Tool Definition` describes the capabilities of a CASE tool, general purpose tool, or any other automation unit that supports the associated `Roles` in performing the work defined by a `Task`. A `Tool` can identify a resource as *useful*, *recommended*, or *necessary* for a task's completion. A `Tool` can also be used to manage one or more `Work Products` [2].

The AUTOSAR Methodology uses the `Tool Definition` to describe AUTOSAR specific (e.g. Software Component Contract Generator) and other general `Tools` (e.g. Compilers). The relationship of a `Tool` to a `Task` shows which `Tools` a `Role` will need to perform the `Task`.

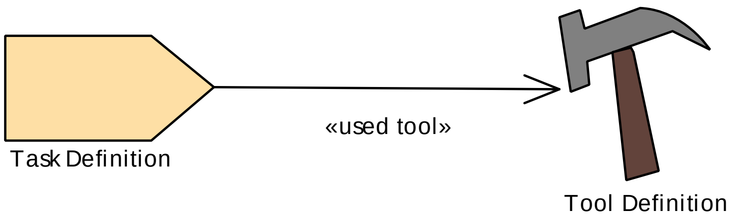

Figure 1.5: Tool Definition Overview

1.5.1.5 Guidance

According to the SPEM meta model, a `Guidance` provides additional information related to e.g. `Roles`, `Work Products`, and `Tasks`. A `Guidance` is classified to indicate a specific type for which perhaps a specific structure and type of content is assumed [2]. A `Guidance` can be a

- `Supporting Material`: `Supporting Material` is a catch-all for other types of guidance not specifically defined elsewhere. It can be related to all kinds of Content Elements, i.e., including other guidance elements. The AUTOSAR Methodology uses the `Supporting Material Guidance` type to define title pages, change histories, disclaimers etc.

- `Tool Mentor`: A `Tool Mentor` shows how to use a specific `Tool` to accomplish some piece of work either in the context of or independent from a `Task` or `Activity`. In the context of the AUTOSAR Methodology, a `Tool Mentor` is used in the same way as the `Tool` element.

- `White Paper`: `White Papers` are concept guidances that have been externally reviewed or published and can be read and understood in isolation from other `Method Content`. AUTOSAR documents are examples of `White Papers`.

Other `Guidances` such as Checklists, Concepts, Estimates, Guidelines, Practices, Reports, Reusable Assets, Roadmaps, or Templates as defined in [2] are not used within the AUTOSAR Methodology.

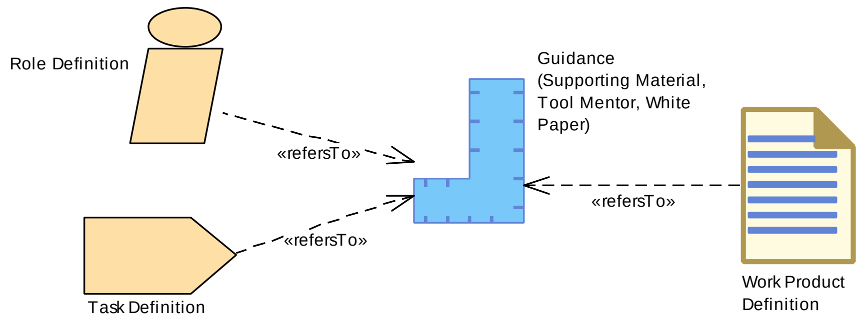

Figure 1.6: Guidance Overview

1.5.1.6 Tables

Beside the graphical visualization of the different SPEM diagrams, tables are used to specify and describe the model elements in detail. In the `Methodology library` the following tables are used :

1.5.1.6.1 Work Product Kind Tables

Category (Work Product Kind)	**Name of Work Product Kind**
Package	Location in the MetaModel package
Brief Description	Short Description
Description	Detailed Description

Table 1.1: Name of Work Product Kind

1.5.1.6.2 Task Definition Tables

Task Definition	**Task**		
Package	Location in the MetaModel package		
Brief Description	Short description		
Description	Detailed description		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Which Roles Perform the Task	Opt or not	Description of the specific role needed
Consumes	What is Consumed by the Task	Mult	Explanation on why this Element is needed.
Produces	What is produced by the Task	Mult	Explanation on why this Element is needed.
UsedTool	Tool used for that Task	Mult	

Table 1.2: Task

1.5.1.6.3 Work Product Definition Tables

Artifact	**Name of the Work Product**

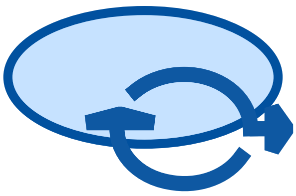
1.5.2 Capability Patterns (Use Case Elements)

The method content (cf. Section 1.5.1) is referenced in section 2.1.2 to describe so-called `Capability Patterns`. A `Capability Pattern` is a process pattern that contains a reusable set of activities. `Capability Patterns` can be assembled to larger `Capability Patterns` that describe development processes or parts of a development process including typical use cases.

The main focus of this section is merely to provide a use case process flow that can be supported by an AUTOSAR tool chain rather than to define a complete process description. One reason for doing this is that the AUTOSAR Methodology should be adaptable to development processes of different organizations (cf. [1, AR_MET_REQ056, AUTOSAR methodology shall not be bound to a particular lifecycle model]).

This section describes the use case elements. The SPEM meta model defines the `Role Use` , the `Work Product Use` and the `Task Use` elements in addition. Whereas these are important elements when applying SPEM in an organization, the AUTOSAR methodology does not necessarily need these elements since no instantiation of the Enterprise Architect model is intended. The elements are thus not used to enhance readability and ease the description. Instead, `Roles`, `Work Products`, `Deliverables` and `Tasks` are used directly to describe the details of an Activity.

The element symbols are shown in Figure 1.7.



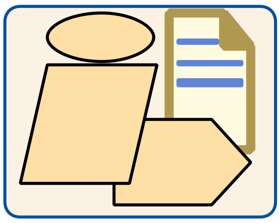


Figure 1.7: Symbols of AUTOSAR Use Case Process Elements

1.5.2.1 Activity

In the SPEM meta model, an `Activity` is the main building block to define a process. An `Activity` is usually a defined task or work to be done that is commonly executed in one sequence. `Activities` can include other `Activities` and thereby often decompose a flow of work and show which `Activity` precedes other `Activities` [2].

At the lowest level, `Activities` are collections of work breakdown elements which in AUTOSAR Methodology are `tasks` , `roles` , and `work products`.

A `Process` is a special `Activity` in the SPEM meta model that describes a typical structure of development projects or parts of them. A `Process` focuses on the lifecycle and the sequencing of work in breakdown structures. `Processes` contain sequences of `Task` and `Activities` and thereby express a lifecycle of the product under development. `Processes` also define how to get from one milestone to the next by defining sequences of work, operations, or events [2].

For the AUTOSAR Methodology, the main `Use Cases` are described with 3 types of diagram. In the first diagram, the `Capability Patterns`, `Activities` and `Deliverables` are used to describe the overall `Use Case`, sequence of `Activities` and their main outputs(`Deliverables`). In these diagrams, the predecessor relationship can be skipped and `Deliverables` can be extended by other `Deliverables` (see Figure 1.8).

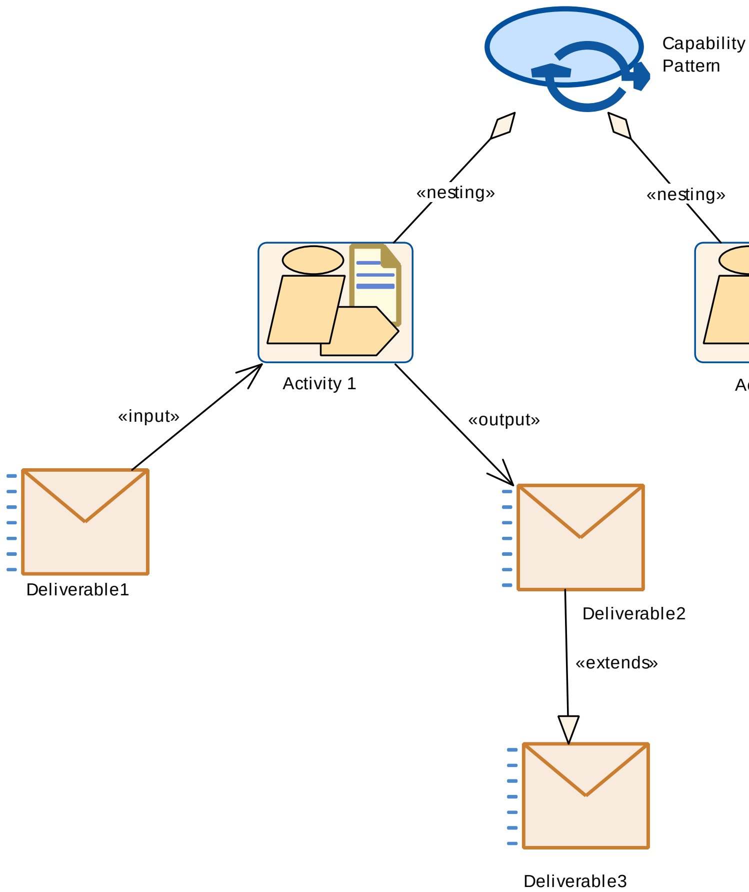

Figure 1.8: Activity Overview

The diagram is followed by its corresponding table as detailed hereunder:

Process Pattern	**Capability Pattern Name**		
Package	Metamodel Package name		
Brief Description	Short Description		
Description	Detailed Description.		
MultipleOccurrences	false/true : if the pattern has Multiple Occurences		
Optional	false/true: if the pattern is optional		
Relation Type	***Related Element***	***Mul.***	***Note***
NestedBreakdownElement	Activity nested to the Capability Pattern or to another Activity	Mult	Context explanation
Consumes	Deliverable consumed by the Activity	Mult	Why this Activity needs to consume this Deliverable
Produces	Deliverable produced by the Activity	Mult	Why this Activity is producing this Deliverable

Table 1.7: Capability Pattern Name

The second type of diagram are `Activities` and `Task definition` diagrams which precise the main `Tasks` and `Work Products` used for the `Use Cases` but are not as detailed than in the Methodology Library (see Figure 1.9). The task usage in these diagrams will be expressed by the role and in the note at the aggregation. This information will be also visible in the generated table. The Work Products consumed or produced in the use cases will be not integrated in the table for readability.

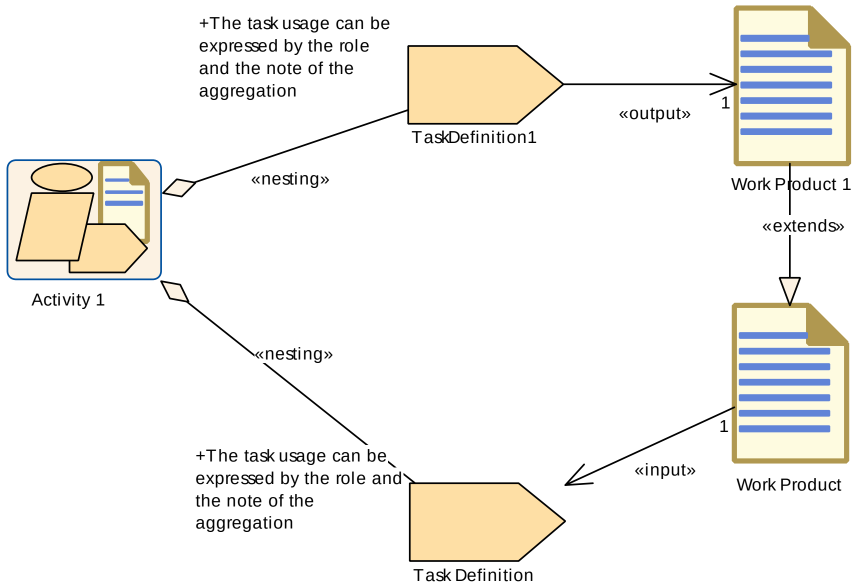

Figure 1.9: Activity and Tasks Overview

The diagram is followed by its corresponding table as detailed hereunder:

Activity	**Name of the Activity1**		
Package	Metamodel Package Name		
Brief Description	Short Description		
Description	Detailed Description		
Relation Type	***Related Element***	***Mul.***	***Note***
NestedBreakdownElement	Nested task definition	Mult	Task usage description if needed

Table 1.8: Name of the Activity1

The third type of diagram contains the `Tasks` and `Work Products` used by an `Activity` in order to show the detailed work flow but not the structure of `Activities` as seen in Section 1.5.1.1. As an example take Figure 2.5. The table generation is not done from this type of diagram.

1.6 Requirements Tracability

This section states the response of this specification to the corresponding requirements document[1].

Requirement	Satisfied by
RS_METH_0006 Methodology shall explain how AUTOSAR system is built	Chapter 2
RS_METH_0033 Methodology should support VFB concept	Chapter 2.2
RS_METH_0041 Methodology shall support the Bottom/Up Approach	Chapter 1.5
RS_METH_0016 Methodology shall support building a system of both AUTOSAR and Non-AUTOSAR ECUs	Chapter 3.1.3.6
RS_METH_0018 Methodology shall be modular	Chapter 1.5
RS_METH_0032 Methodology shall respect the different levels of Abstractions	Chapter 1.5
RS_METH_0020 Methodology shall support iterations	Chapter 1.5
RS_METH_0062 Methodology shall support configuration of parameters with different binding time	Chapter 3.3.1.10 Chapter 3.3.1.4 Chapter 3.6.1.20
Template Requirements	
RS_METH_0002 Methodology shall explain the usage of SW-C template	Chapter 2.3
RS_METH_0003 Methodology shall explain the usage of BSW Module Template	Chapter 2.5
RS_METH_0004 Methodology shall explain the usage of the ECU Configuration template	Chapter 2.6
RS_METH_0005 Methodology shall explain the usage of the System Template	Chapter 2.4
Programming Language	
RS_METH_0015 Methodology shall be independent of programming language	Is fulfilled in a general way; exceptions are visible
RS_METH_0038 Methodology shall support the C programming language	Implicitly
Activities	

Requirement	Satisfied by
RS_METH_0021 Methodology shall define Activities	Chapter 1.5
RS_METH_0043 Activities shall have a purpose	Implicitly
RS_METH_0046 Activities shall have input work products	Chapter 1.5
RS_METH_0047 Activities shall have output work products	Chapter 1.5
RS_METH_0048 Activities shall include roles	Chapter 1.5
RS_METH_0066 Activities shall include tools	Chapter 1.5
Work Products	
RS_METH_0025 Methodology shall define Work products	Chapter 1.5
RS_METH_0050 Work products shall have a description	Chapter 1.5
RS_METH_0051 Work products shall have a reference(s) to metaclass(es) in the Metamodel	Chapter 1.5
RS_METH_0052 It must be possible to avoid duplication of data in Work Products	Chapter 1.5
RS_METH_0054 Work Products shall not have circular references with other work products	Chapter 1.5
RS_METH_0061 Methodology shall describe the change of existing work products	Implicitly
RS_METH_0063 Work Products shall be capable to be version controlled	Chapter 1.5
RS_METH_0069 It shall be possible to add Documentation to a Work Product	Chapter 3.1.2
Guidance	
RS_METH_0027 Methodology shall define unambiguous guidance terminology	Chapter 1.5
RS_METH_0042 Methodology shall incorporate the usage of industry standard tools	Chapter 3.1.5
Roles	
RS_METH_0028 Methodology shall define Roles	Chapter 1.5
RS_METH_0064 Roles shall have a description	Chapter 1.5
Process Requirements	
RS_METH_0056 AUTOSAR methodology shall not be bound to a particular lifecycle model	Chapter 1.5
RS_METH_0057 AUTOSAR Methodology shall support traceability to external artifacts	Chapter 1.5
Development Requirements	
RS_METH_0009 Methodology should be modeled	Chapter 1.5
RS_METH_0010 Methodology should define rules to translate methodology model into a document	Chapter 1.5
RS_METH_0067 Methodology document shall include hyperlinks between Activities, Roles, Work Products, and Guidance	See tables of model elements.
Variant Handling Requirements	
RS_METH_0074 Methodology shall specify Binding times	Chapter 2.11.2
RS_METH_0075 Methodology shall specify the tasks of resolving variant	Chapter 2.11.5 Chapter 3.2.1.16 Chapter 3.3.1.10
RS_METH_0076 Methodology shall specify a workproduct for values of variant selectors	Chapter 3.1.3.3

2 Use Cases

2.1 Overall View

2.1.1 Purpose

This pattern provides a rough outline of the design steps to build a system and resultant of this the ECUs and the topology with the AUTOSAR methodology.

2.1.2 Description

The development of an AUTOSAR System is based on the definition of the `Virtual Functional Bus` named also VFB, which provides a view of all the functions the system supports, independent of any ECUs and networks. See chapter 2.2 for more details.

The VFB is refined into a concrete system by defining a topology of ECUs and Networks, deploying software components to the ECUs, and deriving the communication matrices required to interconnect the distributed features. This can be achieved directly in one phase or in several phases (the use case shows a single phase and a two phase approach).

The two phase approach is used when there is an organizational separation of responsibility where the primary organization defines the overall system in the first phase, and several other organizations define the sub-systems in parallel during the second phase.

The overall system defines the major public ECUs and topologies, and the sub-system design contributes by adding private ECUs and networks to the system. Please note that portions defined within a sub-system are not directly visible to any other subsystem or to the overall system. After the system design is complete, the portions that are related to a specific ECU are extracted producing a deliverable for each ECU. This is elaborated further in chapter 2.4.

In parallel to the system design, the `Software Components` are implemented according to the definitions required by the VFB. These are delivered to be integrated in the ECUs where they are deployed. Please note that the implementation of a software component is more or less independent from ECU configuration. This is a key feature of the AUTOSAR methodology. See chapter 2.3 for more details.

Since the Basic Software modules are independent of the VFB, they can be developed at any time before ECU integration. See chapter 2.5 for more details.

The integration for an AUTOSAR ECU commences when the `Basic Software Modules`, `ECU Extract`, and the implementation of all `Atomic Software Components` are all delivered. At this stage, the ECU is configured by creating tasks, scheduling `Software Component Runnables`, configuring the `Basic Software`

`Modules`, etc. The complete code is compiled and linked into an executable. This is elaborated in chapter 2.6.

2.1.3 Workflow

Table 2.1: Methodology Overview

2.2 Develop a VFB System Description

2.2.1 Purpose

This `Activity` provides a rough outline of the creation of a `Virtual Function Bus` view of a System. [2]

2.2.2 Description

The `Virtual Function Bus` view named also VFB of a System shows how the Systems software functions interact independently of any network topology or deployment of features across multiple ECUs.

For more information on the VFB concept see [3]. For detailed information on the meta-model parts relevant for the VFB see [4].

For the purpose of this use case, this `Activity` is split into three sub-activities:

- Data Model Development
- Component Model Development
- Timing Model Development

In the Data Model Development Activity, the set of `VFB Interfaces`, `VFB Modes`, and `VFB Types` that are used throughout the VFB are defined. Some of these have already been pre-defined by AUTOSAR (so-called “blueprints”), see 3.2.2.7

In the Component Modeling activity, the partitioning of the functions are allocated to components. Following a Top-Down Approach, the highest level `VFB Composition Components` are created, and these are iteratively broken down to smaller components until the `VFB Atomic Software Component` are defined. If a Bottom-Up Approach is used, then the `VFB Atomic Software Component` are first defined, and aggregated together into `VFB Composition Components`.

Several special kinds of `VFB Atomic Software Component`s can be modeled in this activity:

- `VFB Atomic Application Software Component`s are the core elements. They are used to implement the feature algorithms.
- `VFB Parameter Component` are used to provide characteristic values, such as calibration parameters, to software components.
- `VFB Sensor Actuator Component`s provide the connection between physical sensors/actuators and the `VFB Atomic Application Software Component`s.
- `ECU Abstraction Software Component`s can be modeled at this level as well in oder to model the ECU input and output interfaces which are used by sensors and actuators.
- `Complex Device Driver Component`s also have to be modeled here, though their implementation is ECU specific, because their ports need to be connected at the VFB level.

After these activities are completed, the Virtual Function Bus view of the System is defined. At this point, some `VFB Software Component Mapping Constraints` may already be known by design, or based on analyzes such as Define VFB Timing. These can be described to provide guidance to the downstream activities.

2.2.3 Workflow

2.3 Develop Software Components

2.3.1 Develop an Atomic Software Component

2.3.1.1 Purpose

This `Activity` provides a rough outline of the creation of an `Atomic Software Component`.

2.3.1.2 Description

This is the generic `Activity` valid for several kinds of atomic software components. The first step is to create design, including the runnables, events, interrunnable variables, etc. Once this is complete, the contract header files can be created and the software component can be implemented.

Note that the method of implementation, quality, testing, etc. are beyond the scope of this activity.

After the component is implemented and successfully compiled, its resources are measured and stored as part of the software component description for further usage by downstream processes.

The pattern also includes the optional tasks of creating a timing model, binding pre-build-variants and evaluating variants, all in the scope of the atomic software component. Note that the sequence of these optional tasks within the `Activity` is only one possible example.

2.3.1.3 Workflow

Figure 2.4 shows the work breakdown assumed for this use case. The next two figures 2.5 and 2.6 show all the tasks and work products of the method library involved in this use case.

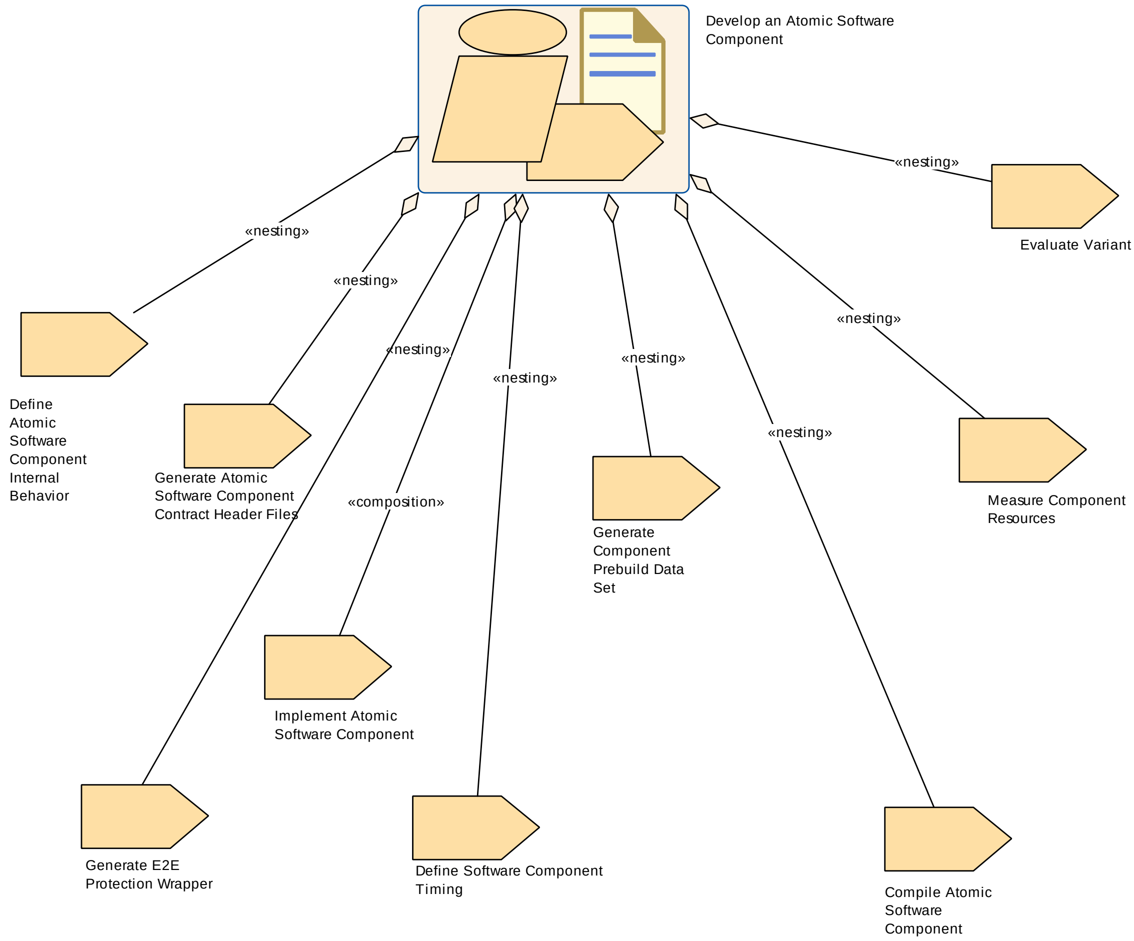

Figure 2.4: Develop an Atomic Software Component

2.3.2 Develop Application Software

2.3.2.1 Purpose

This `Activity` provides a rough outline of the creation of one or more `Application Software Component`s.

2.3.2.2 Description

This `Activity` describes the work flow and the necessary activities in terms of the `AUTOSAR methodology` to develop one or more `Application Software Component`s. The work flow shall allow a more or less independent development of the software components core functionality. These activities have to be performed for each `Application Software Component`.

2.3.2.3 Workflow

The detailed work flow can be derived from the generic activity `Develop an Atomic Software Component`.

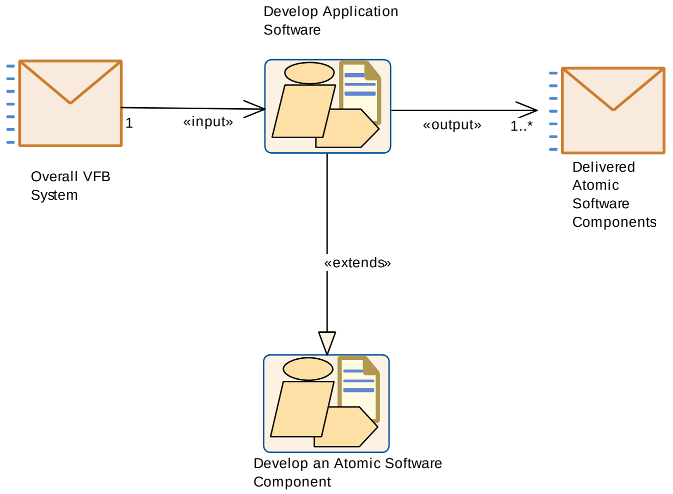

Figure 2.7: Develop an Application Software Component

2.3.3 Uses Cases for more Specialized Software Components

2.3.3.1 Purpose

These `Activities` provides a rough outline of the creation of more specialized components and of the ECU specific optimization of a software component.

2.3.3.2 Description

These `Activities` describe the work flow and the necessary activities in terms of the `AUTOSAR methodology` to develop more specialized components, which could be partially hardware or ECU dependent.

2.3.3.3 Workflow

These work flows can for the most part derived from the generic activity `Develop an Atomic Software Component`. The diagrams show the required extensions.

Note the development of a Service Component does not fall into this category of use cases, because it is for the most part generated during integration time.

For the development of a `VFB Parameter Component` refer to the calibration use case 2.8.

Activity	**Optimize a Software Component for a Specific Target**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::Software Component::Optimize Software Component		
Brief Description	Show how to optimize a software component for a specific target.		
Description	In practice the integration of an application software component has to consider some optimizations to meet performance or resource requirements. The Component API might be much more efficient, if it will be generated particularly adapted to the concrete ECU configuration, e.g. via using macro definitions instead of function calls for some RTE interaction. In fact this should not change the Component Implementation (i.e. the C-sources). That means now we have a different set of component headers, which include the ECU-configuration-specific optimizations. Note: This use case shows the typical steps needed until the recompilation with the optimized header file can be done. It does not show all the other steps needed for the ECU build.

2.4 Develop System and Subsystems

2.4.1 Overview

2.4.1.1 Purpose

The `Activities` to develop the artifacts on the System level include the development of an overall system and optionally the refinement into one or more subsystems. The reason for this split is, that the latter may be done by another organization, as has already been pointed out in 2.1.2.

2.4.1.2 Description

Figures 2.12 and 2.13 show the main inputs and outputs of these two major activities and how they are refined into sub-activities. Note that the activity `Generate ECU Extract` can be performed as part of `Develop System` and `Develop Subsystem` as well.

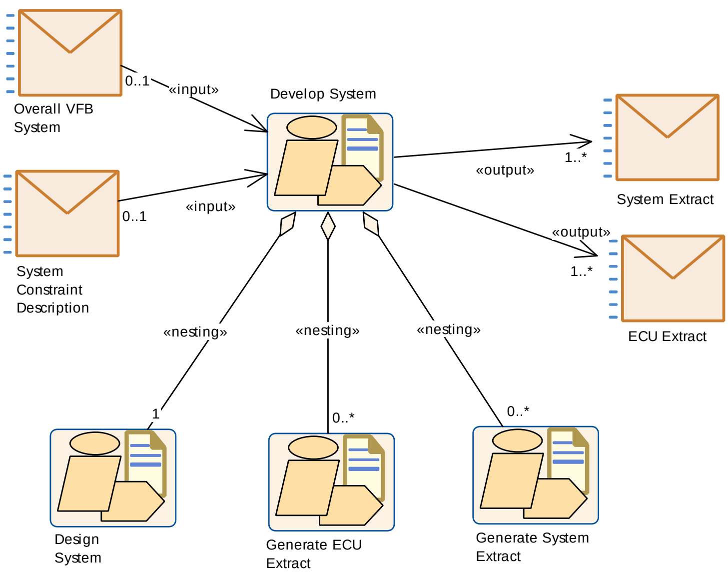

Figure 2.12: Structure of Activity: Develop System

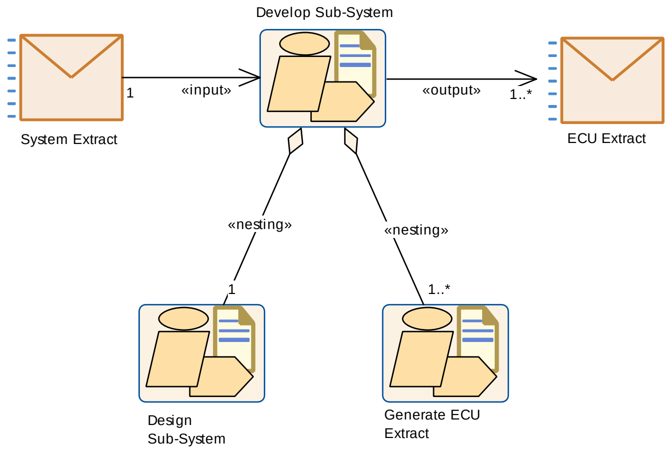

Figure 2.13: Structure of Activity: Develop Subsystem

Figure 2.14 shows how the major deliverables produced during these activities are related and how they refer to artifacts describing the software.

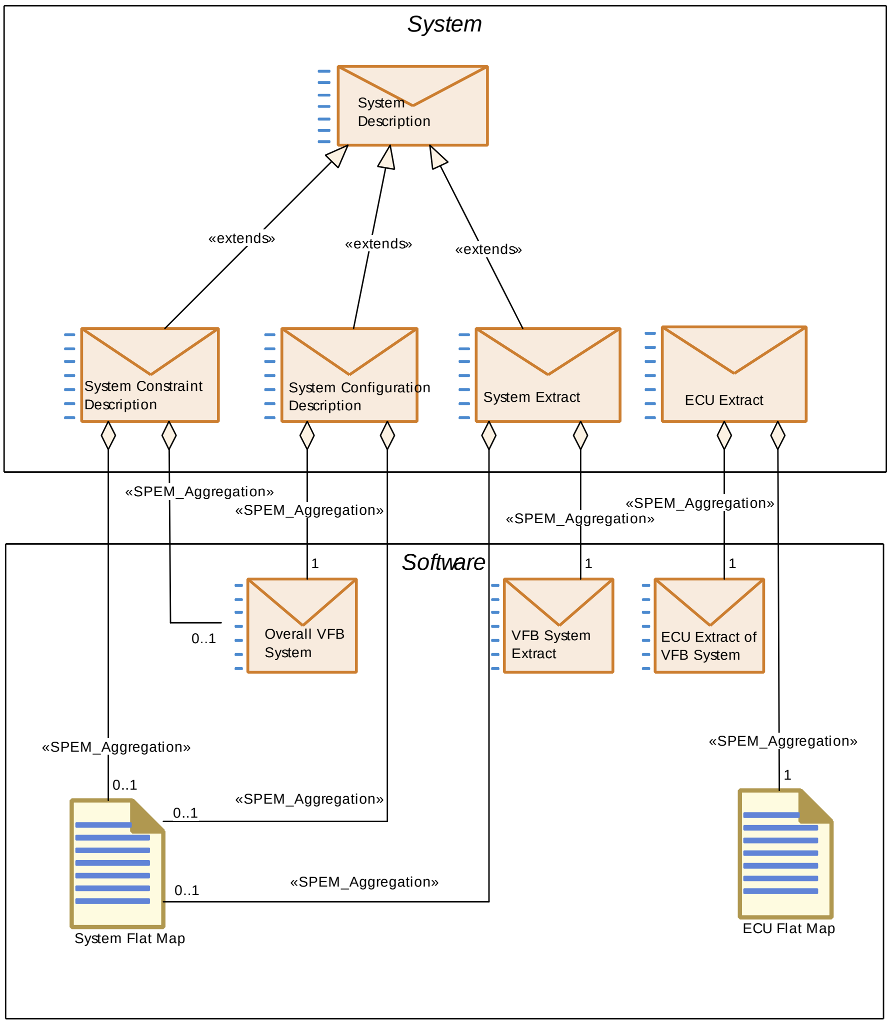

Figure 2.14: Overview on the different roles of deliverables based on System Description

Note that all the deliverables based on the generic deliverable `System Description` as well as the `ECU Extract` consist of ARXML files that are using the meta-model element `System` as the root element, from where the other information can be traced down.

Activity	**Develop System**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::System:: Develop System

Produces	ECU Extract	1..*	

Table 2.13: Develop Sub-System

2.4.2 Design System

2.4.2.1 Purpose

This `Activity` provides a rough outline of the design steps leading to an AUTOSAR `System Configuration Description`, including its topology, deployment, communication matrix, etc.

2.4.2.2 Description

The design of an AUTOSAR `System Configuration Description` uses input information from a `System Constraint Description` and is based on an `Overall VFB System` for the software part.

The activity involves the creation of a `Topology`, `ECU Resources Description`s, and the interconnection between ECU instances.

The AUTOSAR Software Components defined within the `VFB Top Level System Composition` are then deployed to the ECU instances.

The required network signals are identified and a mapping is done to `System Signal`s to implement the VFB. `System Signal Group`s, are defined to keep certain signals grouped together for atomic transmission. `System Signals` are then defined and form the initial input to design the `Communication`.

During this stage, design constraints can also be defined `Mapping of Software Components to Implementations`, `Mapping of Software Components to ECUs`, `Signal Path Constraint`, and `Software Component Mapping Constraint`. These constraints serve many purposes including the ability for tools to use them to optimization a system, to interface with legacy ECUs, and to ”lock” design decision between iterations.

Note: The mapping of software components to implementations is optional and needed only if those components are specifically required to be used in an ECU.

Depending on the intended work split, the `System Configuration Description` produced during this activity can be used as a basis

1. to create one or more so-called `System Extract`s as a basis for further refinement as sub-systems (see 2.4.4)
2. or to generate `ECU Extract`s which directly contain all relevant information to be integrated on an ECU (see 2.4.5)

In the first case, only an `outer system` is defined. Based on the `outer system`, one or more `System Extract`s can be delivered. The `System Extract` is not fully decomposed and still needs to be refined before it forms the basis for the `ECU configuration`. `Atomic Software Components`, additional `ECU`s, `Networks` and the resulting communication will be added during the refinement step in the activity `Design Subsystem`.

2.4.2.3 Workflow

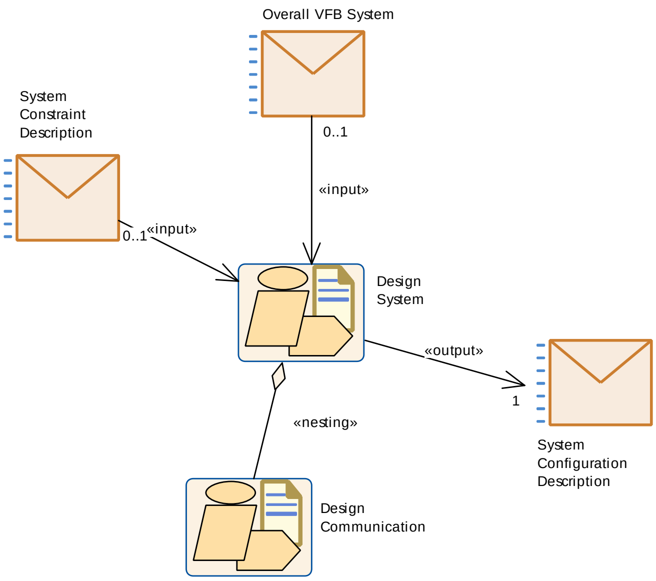

Figure 2.15: Structure overview: Design System

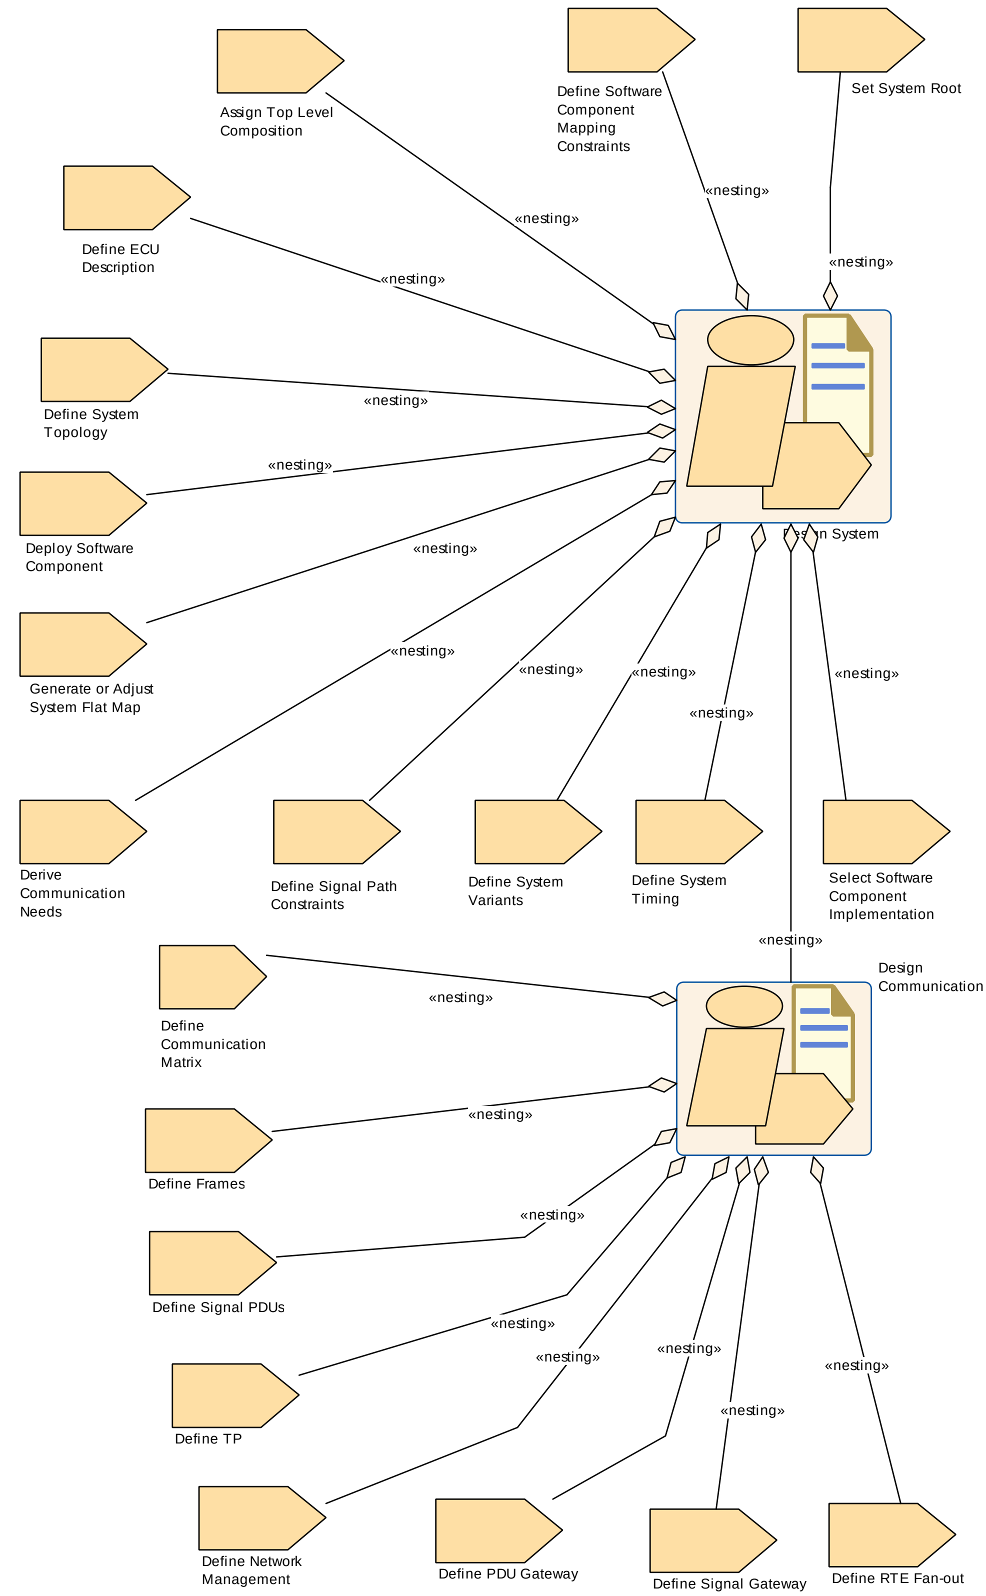

Figure 2.16: Nesting relationship: Design System

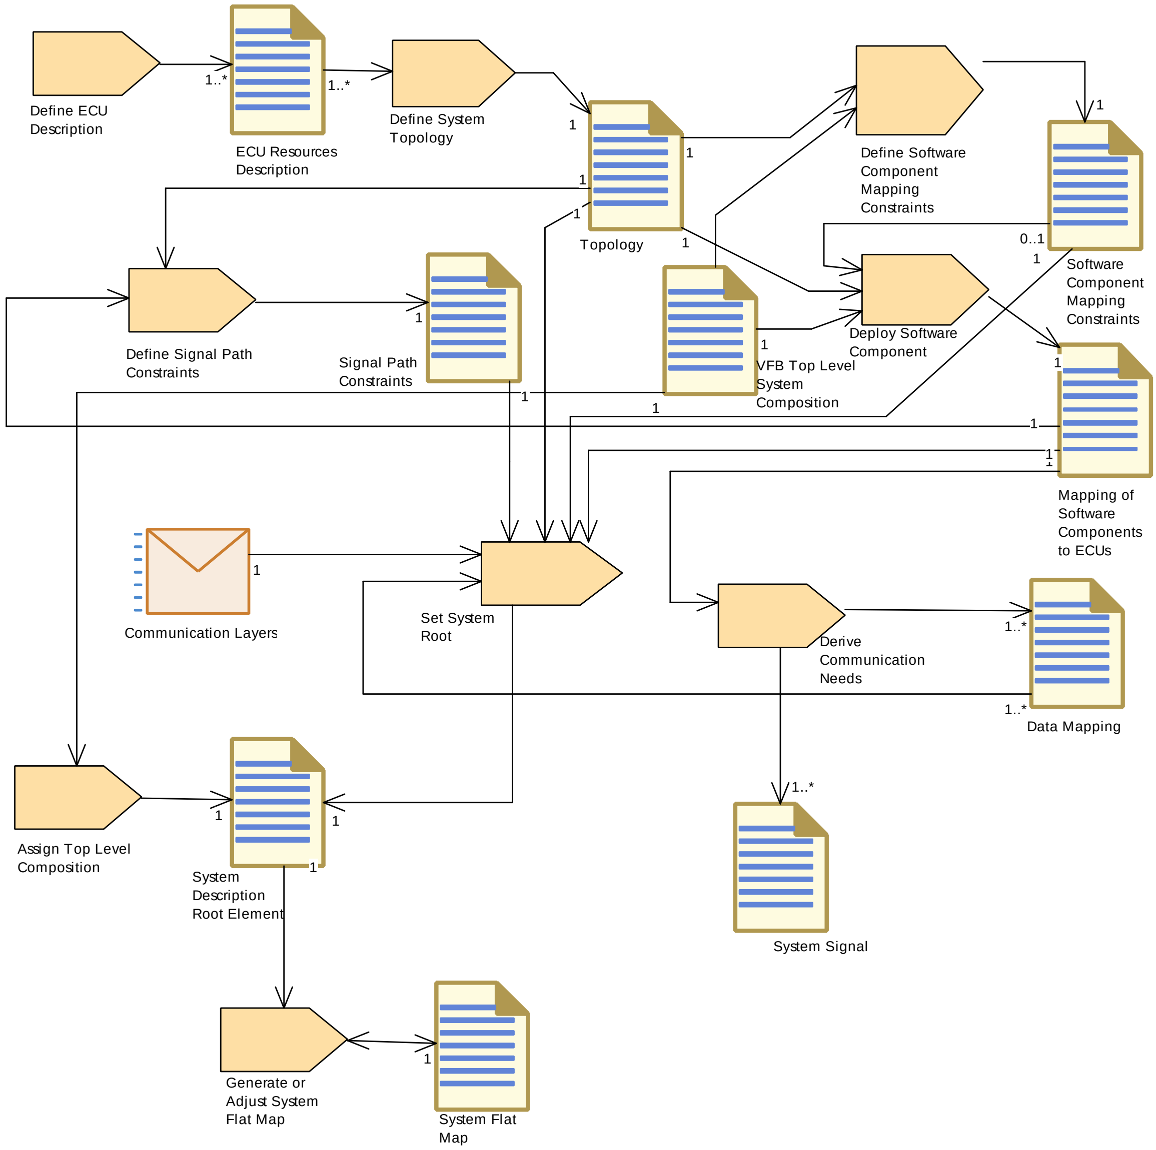

Figure 2.17: Detailed work flow for: Design System

Activity	Design System		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::System::Design System		
Brief Description	Initial work to create a topology, map a VFB onto that topology and determine the ECU resources each ECU needs.		
Description	The design of an AUTOSAR System involves the creation of a Topology, ECU Resources Descriptions, and the interconnection between ECU instances. The software components defined within the VFB Top Level System Composition are then deployed to the ECU instances. The required network signals are identified and a mapping is done to System Signals to implement the VFB. System Signal Groups, are defined to keep certain signals grouped together for atomic transmission. System Signals are then defined and form the initial input to design the Communication Matrix. During this stage, design constraints can also be defined (Mapping of Software Components to Implementations, Mapping of Software Components to ECUs, Signal Path Constraint, and Software Component Mapping Constraint). These constraints serve many purposes including the ability for tools to use them to optimization a system, to interface with legacy ECUs, and to "lock" design decision between iterations. Notes: The mapping of software components to implementations is optional and needed only if those components are specifically required to be used in an ECU.

2.4.3 Generate System Extract

2.4.3.1 Purpose

This `Activity` provides an extract of the system description for a specific sub-system.

2.4.3.2 Description

Generate a `System Extract` which is a basis to develop a sub-system.

2.4.3.3 Workflow

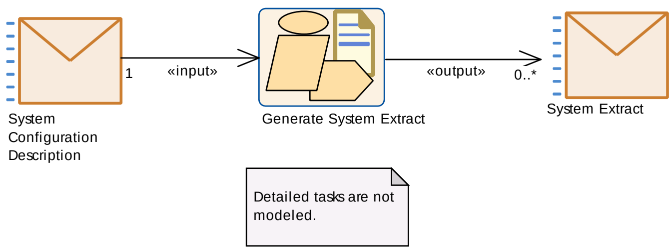

Figure 2.18: Generate the System Extract

The detailed tasks of `Generate System Extract` are not modeled since they are considered as trivial - it just means to reduce the content of the input description to the subsystem in question.

Activity	**Generate System Extract**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::System::Generate System Extract		
Brief Description			
Description	Generate for further development, a System Extract which represents the description of a part of the system (sub-system). This allows a start of work on ECU's even if the system is not completely described.		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	System Configuration Description	1	
Produces	System Extract	0..*	

Table 2.16: Generate System Extract

2.4.4 Design Sub-System

2.4.4.1 Purpose

This `Activity` details a given `System Extract` with additional ECUs and networks.

2.4.4.2 Description

Based on the delivered `System Extract`, the complete description of a sub-system is defined. This means that all `Atomic Software Components` in the sub-system scope are included in this description. During this step, additional ECUs can be added to the topology and to the `Communication Matrix` already defined in the given `System Extract`.

2.4.4.3 Workflow

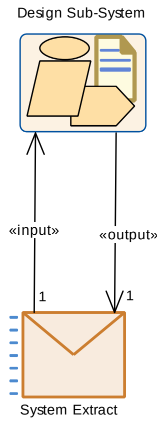

Figure 2.19: Overview: Design Sub-System

Note that the `System Extract` appears as input and output of this Activity because it is refined.

As the detailed work flow for this Activity uses the same elements from the methodology library as the one described in 2.4.2.3, the breakdown into tasks is not modeled here.

Activity	**Design Sub-System**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::System::Design Sub-System		
Brief Description			
Description	Design the sub-system artifacts based on a System Extract. It consists of the same tasks as the activity Design System. The description must be completed down to the ECU level, so that valid ECU extracts can be generated.		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	System Extract	1	System Extract as generated from the outer system.
Produces	System Extract	1	System Extract refined during design of the corresponding sub-system with elements needed to generate ECU Extract(s).

Table 2.17: Design Sub-System

2.4.5 Generate ECU Extract

2.4.5.1 Purpose

This `Activity` provides an extract of the System description for setting up an ECU Configuration for specific ECU.

2.4.5.2 Description

Generate an `ECU Extract` basis for setting up the ECU configuration and further development on ECU level.

2.4.5.3 Workflow

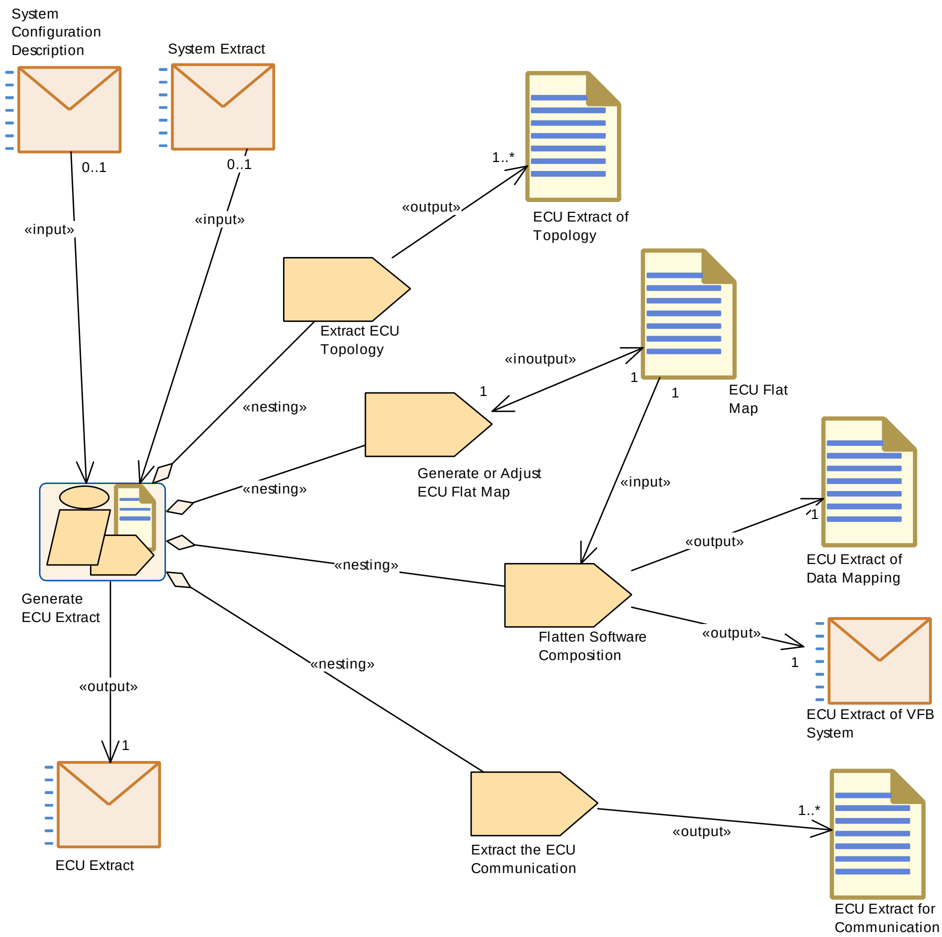

Figure 2.20: Generate the ECU Extract

Activity	**Generate ECU Extract**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::System::Generate Ecu Extract		
Brief Description	Generate the ECU Extract out of the System Description in order to be delivered for integration for further development on ECU level.		
Description	Generate the ECU extract which is a basis for setting up the ECU configuration and further development on ECU level. It can be generated either from a full system or a system extract.

Table 2.19: Develop Basic Software

It consists of two parts:

- Design Basic Software
- Develop Basic Software Module

2.5.2 Design BSW

2.5.2.1 Purpose

This `Activity` provides a rough outline for the Basic Software design for an ECU or a set of ECUs.

2.5.2.2 Description

Design the Basic Software for an ECU or a set of ECUs. This shall result in a set of complete and unambiguous `Basic Software Module Descriptions`.

Note that existing descriptions, especially standardized ones, can be reused, eventually setting only optional elements or user specific extension.

This `Activity` is conceptually separated from `Develop BSW Module`, because it might be performed by a `Basic Software Designer` responsible for the complete Basic Software Design on a given ECU, which may be different in general from the Basic Software Module Developer who develops or delivers the single modules.

2.5.2.3 Workflow

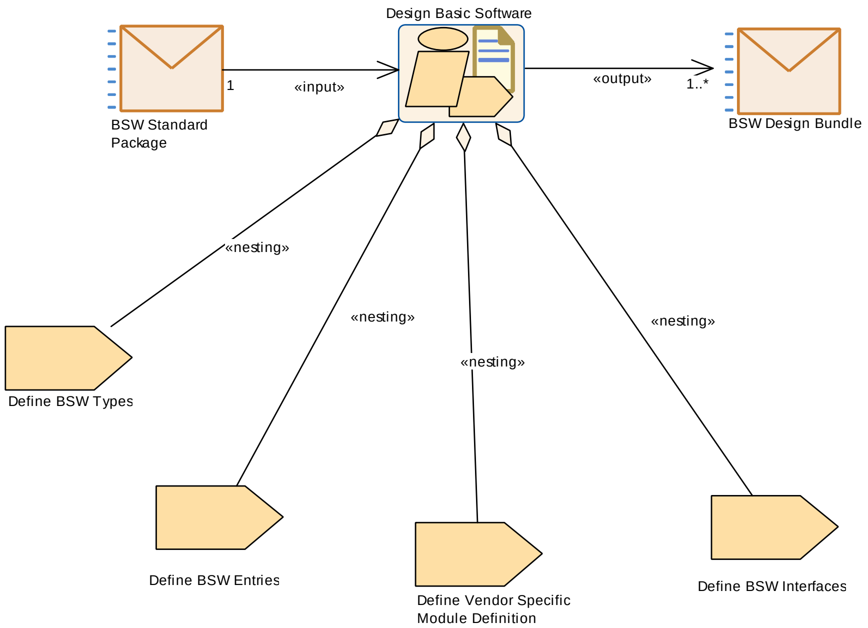

Figure 2.22: Nesting Relationship : Design Basic Software

Table 2.21: Develop BSW Module

2.6 Integrate Software for ECU

2.6.1 Description

In this chapter, the integration for an AUTOSAR ECU is described. In the AUTOSAR sense an ECU means a microcontroller plus peripherals and the according software/-configuration. Therefore, each microcontroller requires its own ECU Configuration. The main activities include configuring and/or generating the BSW modules (including the RTE) and building the executable. The BSW configuration can be done during different steps of development. The detailed use cases for these different ways of configuration are introduced later in the chapter, thanks to the `Configuration Classes` definition :

- `Pre-compile time`
- `Link time`
- `Post-build time`

2.6.2 Complete View

2.6.2.1 Purpose

This `Activity` is showing the high level view how to integrate AUTOSAR Software for an ECU.

2.6.2.2 Description

The development of an AUTOSAR ECU consists of four main activities:

- `Prepare ECU Configuration`
- `Configure BSW and RTE`
- `Generate BSW and RTE`
- `Build Executable`

In addition, the optional activity `Model ECU Timing` is shown. The ECU timing model depends on ECU configuration details (BSW and RTE), but the results shall help to optimize the configuration in an iterative approach.

During the `Prepare ECU Configuration` activity, the information available in `ECU Extract` for the specific ECU is extended by implementing the `Service Needs` required by the Software Components and BSW Modules and by including their initial configurations as provided in the `Basic Software Module Preconfigured Configuration` or `Basic Software Module Recommended Configuration`. The result of this activity is the initial `ECU Configuration`.

In addition, the `Basic Software Module Vendor-Specific Configuration Parameter Definition`, which defines all possible configuration parameters and their structure, is incorporated into the `ECU Configuration`. This is necessary because the output `ECU Configuration` has a flexible structure which does not define a fixed number of configuration parameters a priori.

Once there is a base `ECU Configuration`, the complete configuration can be performed. This is mainly editing work on the `ECU Configuration` which is typically supported by an editing tool. In practice this will require iterations and/or parallel work to configure the RTE and all participating BSW modules.

The methodology does not prescribe a certain order of these configuration steps. The `ECU Configuration Description` which was produced by one activity can be read by another activity (e.g. `Configure RTE` generates a description and `Configure COM` reads this). Usually the configuration activities for the BSW modules (e.g. COM and OS) read and write the `ECU Configuration`.

The `Configure RTE` task is more complex as this additionally needs all the `Atomic Software Component Implementation`s required for that ECU. Whenever these change, e.g. because software components have been moved to or from other ECUs, or simply another implementation of a software component has been selected, the `Configure RTE` task must be repeated as well.

Finally the `Configure Debug` task can be completed. Since this configuration depends on previous configuration results, it should be completed last.

After the `ECU Configuration` is completed, the BSW modules, RTE, and OS source files are generated. These are compiled and linked along with all the applications, libraries, etc. to build the `ECU Executable`. The details of the various compiling and linking options are explained in the chapters 2.6.3, 2.6.4, 2.6.5 and 2.6.6.

One can `Measure Resources` used by the various BSW modules and applications and save that information within the `Basic Software Module Implementation` or `Atomic Software Component Implementation`.

One can also `Generate A2L` at this point.

2.6.2.3 Workflow

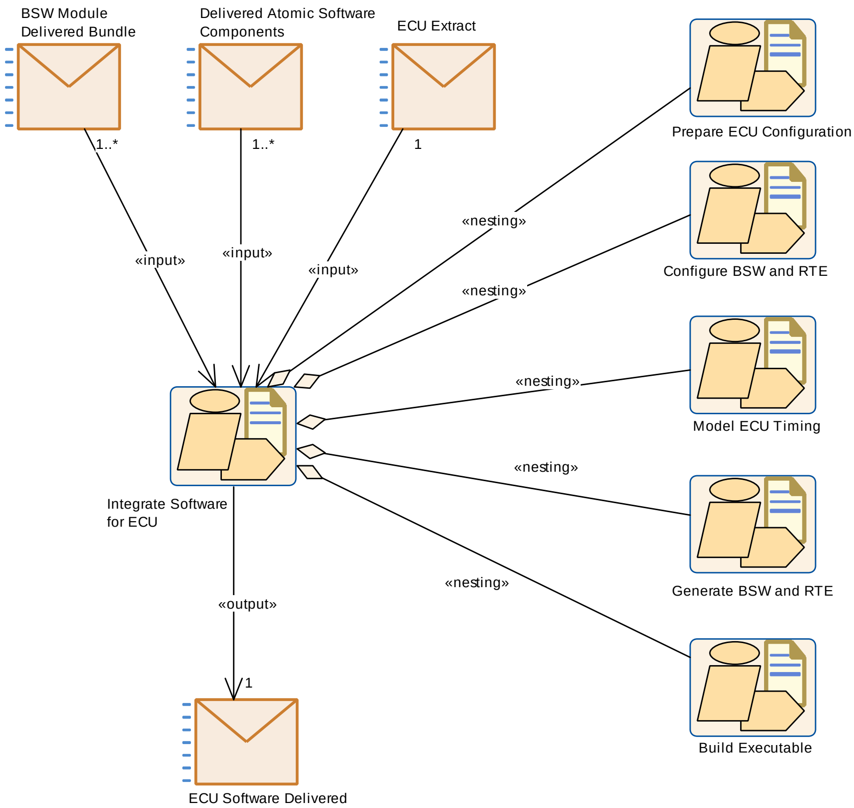

Figure 2.26: Integrate Software on ECU Overview

Activity	**Integrate Software for ECU**		
Package	AUTOSAR Root::M2::Methodology::Methodology Use Cases::ECU::Integrate Software for ECU		
Brief Description			
Description	This activity contains all typical sub-activities required to integrate the software components and modules on an AUTOSAR ECU. ECU in this context means processor, so if an electronic control unit consists of several processors, one "ECU Delivered" will be needed for each processor.

2.6.3 Configuration Class: Pre-compile Time

(from ecuc sws 1031, see [5]) This type of configuration is a standalone configuration done before compiling the source code. That means parameter values for those configurable elements are selected before compiling and will be effective after compilation time. The value of the configurable parameter is decided in earlier stage of software development process and any changes in the parameter value calls for a re-compilation. The contents of pre-compile time parameters can not be changed at the subsequent development steps like link time or post-build time.

2.6.3.1 Description

The work breakdown structure shows two approaches:

The first approach is to generate a `BSW Module Configuration Header`, then compile the module core code using this header file. In this case the module core code is not touched by the `BSW Configuration Generator`.

An alternative approach, in which the `BSW Configuration Generator` generates the complete, configuration-specific `Basic Software Module Configuration Header Files` plus `BSW Module Completely Generated Source Code`. In this case, no core code exist.

Both approaches are equally valid.

Whenever the decision of parameter value must be taken before the selection of other dependable parameters, pre-compile time configuration is the right choice. For example, the algorithm choice for CRC initial checksum parameter is based on the selection of CRC type (CRC16 or CRC32). When CRC16 is selected, there will be increase in processing time but reduction in memory usage. Whereas when CRC32 is selected, there will be decrease in processing time but increase in memory usage. The correct choice should be made by the implementer before compilation of source code based on the requirement and resource availability.

Sample cases where `pre-compile time configuration` can be adopted are:

- Configure the number of memory tables and block descriptor table of NVRAM manager.
- Enable the macro for the development error tracing of the software modules.

2.6.3.2 Workflow

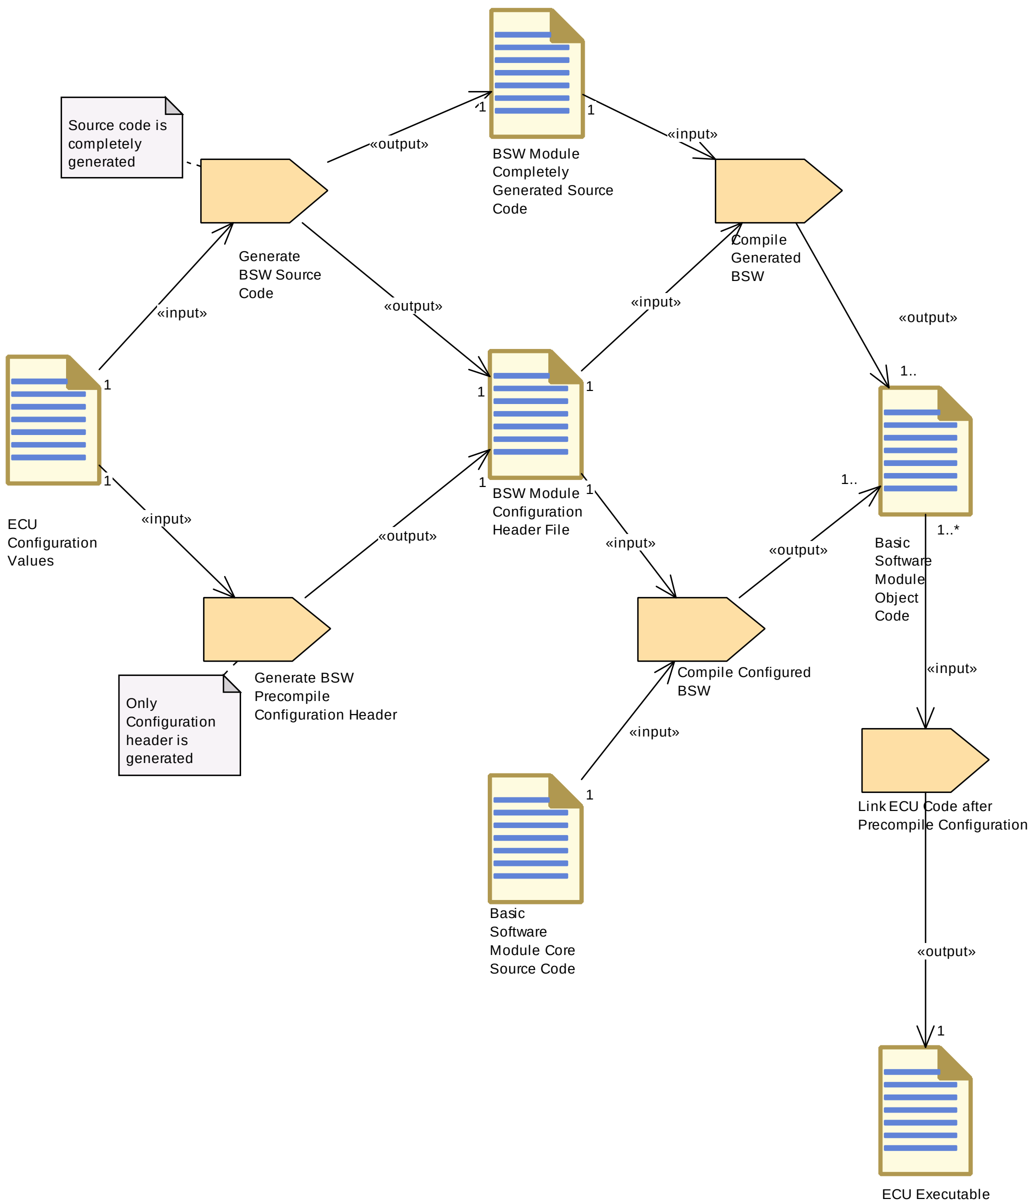

Figure 2.34: Pre-compile time configuration overview

NestedBreakdownElement	Generate BSW Source Code	1	
NestedBreakdownElement	Link ECU Code after Precompile Configuration	1	

Table 2.28: Do Pre Compile Configuration

2.6.4 Configuration Class: Link Time

(from ecuc sws 1032, see [5]) This type of configuration is done for the BSW module during link time. That means the object code of the BSW module receives parts of its configuration from another object code file or it is defined by linker options. Link time parameters are typically used when delivering object code to the integrator.

2.6.4.1 Description

This configuration class provides a modular approach to the configuration process. A separate module will handle the configuration details and those parameter values will be made available to the other modules during the linking process.

The first step is to `Generate BSW Configuration Code`, which produces the `BSW Module Configuration Data Source Code` and the `BSW Mdule Configuration Header File`. These are compiled along with the `Basic Software Module Core Header` into the `BSW Module Configuration Data Object Code`.

The configuration parameter data is defined in a common header file `Basic Software Module Core Header` and included by both `Basic Software Module Core Source Code` and `Basic Software Module Configuration Data Source Code`. The module source file needs this header file to resolve the references and module configuration source file will need it in order to cross check the declaration of data type against the definition.

Both module source file and module configuration source file are compiled separately to generate `Basic Software Module Object Code` and `BSW Module Configuration Data Object Code` respectively. During the linking process, the configuration data will be available to `Basic Software Module Object Code` by resolving the external references. When the values of configuration parameters change the `Basic Software Module Object Code` needs to be re-generated.

Sample cases where Link time configuration can be adopted are:

- Initial value and invalid value of signal
- Unique channel identifier configured for the respective instance of the Network Management.
- Logical handle of CAN network.
- Identifier and type of Hardware Reception Handle and Hardware Transmission
- Handle for CAN interface.
- Iefinition of ComFilterAlgorithm.
- COM callback function to indicate RTE about the reception of an invalidated signal.

2.6.4.2 Workflow

Table 2.29: Do Link Time Configuration

2.6.5 Configuration Class: Post-build Time Loadable

[from ecuc sws 4006, see [5]] This type of configuration is possible after building the BSW module or the ECU software. The BSW module gets the parameters of its configuration by downloading a separate file to the ECU memory, avoiding a re-compilation and re-build of the BSW module.

2.6.5.1 Description

There are two different approaches:

1. In order to make the post-build time loadable re-configuration possible, the re-configurable parameters shall be stored at a known memory location of the ECU memory. In this approach the `Basic Software Module Core Source Code` is compiled and linked independently of its configuration data. The `BSW Configuration Generator` generates the configuration data as `Basic Software Module Configuration Data Source Code` that is compiled and linked independently of the core source code.

2. In the second approach, the `Basic Software Module Configuration Data Loadable` to ECU Memory is stored at a known memory location and it is possible to exchange the configuration data without replacing the `ECU Executable`. The difference compared to the first approach is that the `BSW Configuration Generator` does perform also the tasks performed by the compiler and linker in the prior approach. I.e the `Basic Software Module Configuration Data Loadable to ECU Memory` is generated directly by this generator. The configuration data and the executable is still independently exchangeable.

Sample cases where post-build time loadable configuration can be adopted are:

- Identifiers of the CAN frames
- CAN driver baudrate and propagation delay
- COM transmission mode, transmission mode time offset and time period

Table 2.30: Do Post Build Loadable Configuration

2.6.6 Configuration Class: Post-build Time Selectable

[from ecuc sws 4007, see [5]] Post-build time selectable makes it possible to define multiple configuration sets. Which set will become active is chosen during boot-time.

2.6.6.1 Description

In this use case, the `BSW Configuration Generator` generates two or more sets of configuration parameters within `BSW Module Configuration Header Files` and `BSW Module Configuration Data Source Code`. The configuration data is compiled and linked together with the `Basic Software Module Core Source Code`.

The resulting `ECU Executable` includes all configuration sets as well as the source code of the BSW module. I.e. it is not possible to exchange the configuration data without re-building the entire executable.

2.7 Components and Services

2.7.1 Purpose

This use case focuses on the activities required to use and configure AUTOSAR Services. It is therefore a subset of the overall use case (see 2.1).

2.7.2 Description

Atomic Software Components can use AUTOSAR Services. In order to do so, two things have to be defined on the VFB and Software Component level:

- The ports which are to be connected to the Service during ECU integration (this is a sub-task of `Define VFB Application Software Component`). The port interfaces used for service ports should be standardized.
- The needs to configure the Service (for example NvM blocks or symbolic names for diagnostic events) from the perspective of the single Software Component (this is a sub-task of `Define Atomic Software Component Internal Behavior`.)

The service ports have impact on the component API just like any other port, so there is no difference between service ports and "normal" ports with respect to API generation.

When the Application Software Components are mapped to an ECU their description is put into the corresponding `ECU Extract`. These activities belong to the System domain (see 2.4.5) and are not explicitly shown in this use case.

As part of the ECU integration, additional artifacts are generated to connect the service ports over the RTE: `Service Component Description`s, including their mapping to the Basic Software Modules, and the connectors between their ports and the service ports of the `Application Software Component`s.

The use case shows also the creation of ECU configuration of the corresponding Basic Software Module (e.g. DEM, DCM, Watchdog Manager etc.). This must be done with respect to the service ports and the `ServiceNeeds` of all `Application Software Component`s connected to the corresponding Service Component (the diagram shows only the configuration activity of diagnostics as an example).

2.7.3 Workflow

Figure 2.42 shows the work sequence assumed for this use case. The next two figures 2.43 and 2.44 show the tasks and work products of the method library involved in the activities on the VFB and Component resp. the ECU level.

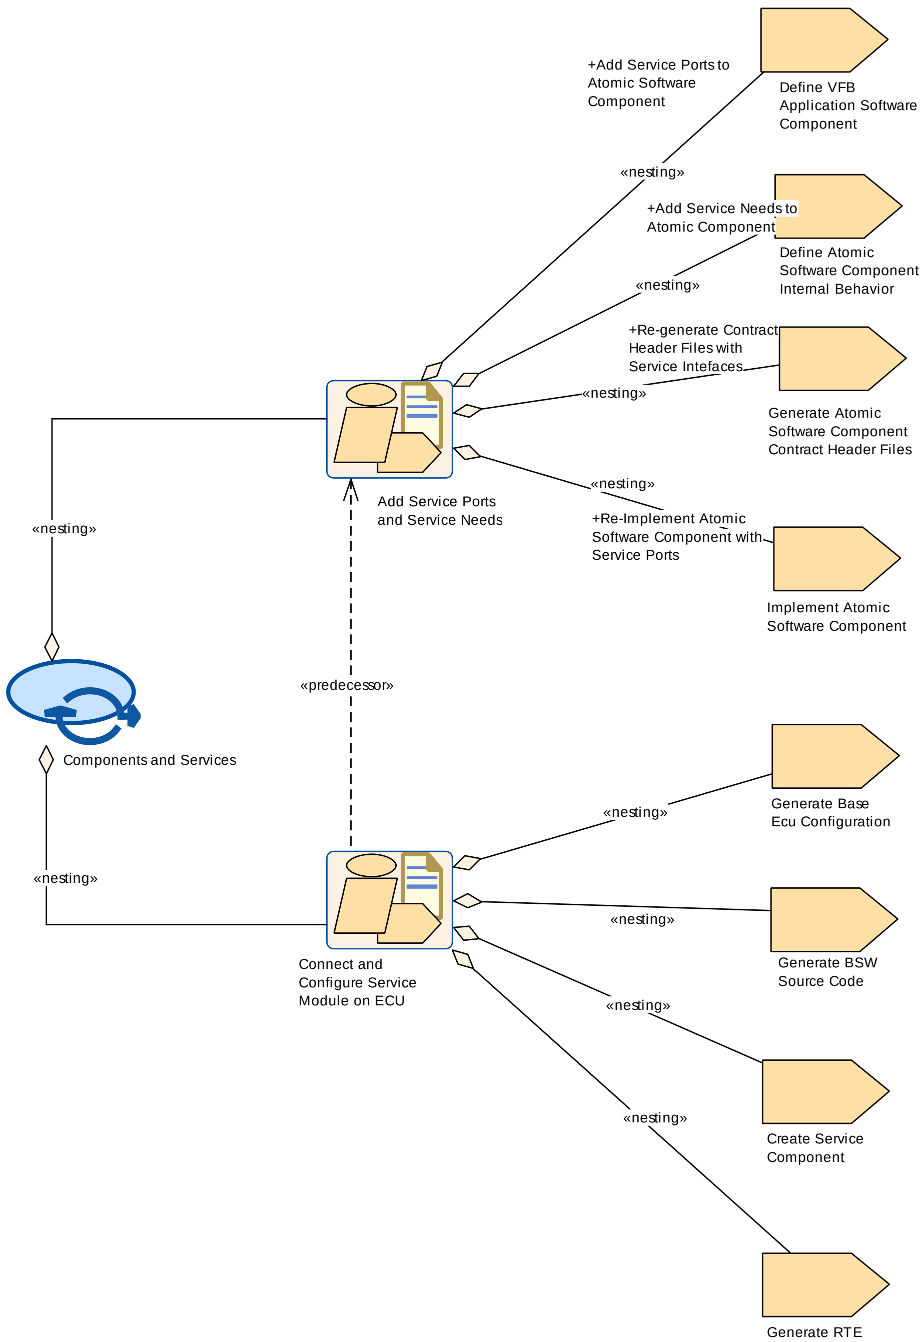

Figure 2.42: Use Case: Components and Services

Process Pattern	**Components and Services**

2.8 Calibration Overview

2.8.1 Purpose

This use case describes the typical activities required from the creation or update of calibration parameters down to the creation or update of the A2L files.

2.8.2 Description

The use cases assumes, that calibration parameters are changed in an already existing system, thus the tasks required to define and build a new system are omitted, only the calibration relevant steps are shown.

In addition, the use case includes the (optional) task of updating a set of calibration parameter values as input for the RTE.

As far as AUTOSAR artifacts are involved, this use case can be divided into four major activities:

- `Define Cross-component Calibration Parameters`: Contains the tasks used to define or update cross-component calibration parameters. These parameters have to be provided via ports by `Parameter Components`.
- `Define Local Calibration Parameters`: Contains the tasks used to define or update component-local calibration parameters or calibration parameters defined within a BSW module. These parameters are declared within the `Internal Behavior` of the component (or the BSW module) which uses them.
- `Provide Unique Parameter Names`: Contains the tasks used to provide unique names for calibration parameters. A `Flat Map` is used to provide unique names for MCD tools. An `Alias Name Set` can be provided additionally in cases, where this is not sufficient.
- `Re-generate RTE and Calibration Support`: Contains the tasks used to re-generate relevant artifacts during ECU integration (before the final build) after an update of calibration parameters.

2.8.3 Workflow

Figure 2.45 shows the work sequence assumed for this use case.

Table 2.39: Re-generate RTE and Calibration Support

2.9 Memory Mapping

2.9.1 Purpose

This use case gives a comprehensive view on the tasks required to define, configure and generate header files for memory mapping. The underlying concept is specified in [6].

2.9.2 Description

AUTOSAR basic software as well as application software use a standardized preprocessor mechanism in order to define memory sections for their data and code. The goal of this mechanism is to maintain the compiler specific statements and the ECU specific mappings separately from the main code.

With AUTOSAR R4.0.2 it is possible to derive (i.e. generate) the content of these header files from XML artifacts. This use case shows how the required artifacts and tasks are related.

2.9.3 Workflow

Figure 2.46 shows the work sequence assumed for this use case. The next figure 2.47 shows the involved tasks and work products of the method library.

Note that this use case ends with compilation of the code. The assignment of memory sections to the actual hardware (which is typically done by the configuration of the linker) is currently not considered to be part of the AUTOSAR methodology.

2.10 E2E Protection

2.10.1 Purpose

This `Activity` provides a rough outline of the creation of `E2E Protection` to secure communication flow in an AUTOSAR Architecture. [2]

2.10.2 Description

The `E2E Protection` is needed when safety related data exchanges need to be protected at runtime against communication link faults. The `E2E Protection` is protection wrapper over communication at the level of `SW Components` or the `COM's I-PDU` using a `E2E library`.This safety wrapper can be implemented either into the `SW Components` only for `sender-receiver` communication or at the level of the `COM's I-PDU` when the integrity of operation of `COM` and `RTE` is provided.

For a better understanding this use case is splitted into two sub-activities:

- Define E2E Protection Set

- Regenerate E2E Protection Wrapper

The Activity Define E2E Protection Set is needed to define all information needed at run time for the E2E Protection wrapper like pre-defined Profiles configuration used in the E2E library with their corresponding Functions Parameters.

The Activity Regenerate E2E Protection Wrapper is describing the generation and implementation of the E2E Wrapper at the SW Componant level using the E2E Protection Set, the SWC Internal Behavior and the overall VFB System information.

2.10.3 Workflow

Figure 2.48 shows the work sequence for this use case.

2.11 Variant Handling

2.11.1 Overview

Variant Handling for AUTOSAR is defined in the Generic Structure Template Template [7]. First, this concept defines means to designate certain locations in the AUTOSAR metamodel as *variation points*. A point roughly consists of a condition (under which conditions is this variation active?) and a binding time (when should this variation be resolved?).

Second, there are *predefined variants*. A typical AUTOSAR model may contain a large number of variation points. However, usually only a relatively small number of variants (i.e., combinations of “active” variation points) is actively used. Each predefined variant describes such a variant.

2.11.2 Binding Times

The AUTOSAR variant handling defines two kinds of binding times for AUTOSAR: the *latest binding time* and the *actual binding time*. They have the same kinds of values[1], but are used in different contexts. AUTOSAR defines the following binding times (presented here in chronological order):

- `BlueprintDerivationTime`
- `SystemDesignTime`
- `CodeGenerationTime`
- `PreCompileTime`
- `LinkTime`
- `PostBuild`

The Generic Structure Template mentions two more binding times. First, there is `FunctionDesignTime`, which comes before `SystemDesignTime`, but is independent of `BluePrintDerivationTime`. Second, there is `Runtime`, which comes after `PostBuild`. These binding times are not covered by AUTOSAR and mentioned here only for completeness.

It should also be noted that a binding “time” is not really a point in time, but rather denotes a phase in the development of an AUTOSAR system.

2.11.2.1 Latest Binding Time

In the AUTOSAR meta model, every variation point has a latest binding time, which is implemented by the tag `Vh.LatestBindingTime`. As the name suggests, the latest binding time of a particular variation point puts an upper limit on *when* this point can be bound. A variation may be bound earlier than this time, but not later.

For example, the latest binding time for a software component which is part of a composition is `PostBuild`. In other words, an ECU can be configured to decide at startup whether a software component is active or not.

[1] `BlueprintDerivationTime` and `PostBuild` are not part of the actual enum that is used in the metamodel, but they are implied by the structure of the variation point. See chapter 7 in the Generic Structure Template Template [7] are more details.

However, it is not always possible to bind a variant at the latest *possible* time. To continue the above example, making all software components `PostBuild` means that an executable always contains code and other resources for all software components, regardless whether it gets activated or not. Because of this, it may happen that the executable becomes too large to fit onto its designated ECU. If this is the case, the software component needs to be bound earlier, typically at PreCompileTime or even at SystemDesignTime.

This is not the only scenario that leads to this decision. For example, a software component might two or more several subcomponent each of which is specific to a certain vendor. In this case, before delivering the software component to a specific vendor, it is custom to remove the subcomponents that are targeted at the other vendor(s). This can obviously be done at `PrecompileTime` the latest.

There are also cases where there is an implicit (i.e., not stated of the metamodel) lower limit for the binding time of a variation point. For example, if a variant in software component A uses a variant in software component B, then the binding times need to be coordinated. Component A cannot be `SystemDesignTime` if component B is `PostBuild`, but makes use of software component A.

2.11.2.2 Actual Binding Time

This brings us to the actual binding time of a variation point, which is stored in an attribute[2] of the variation point. Again, it is not mandatory that the variation point is bound exactly at this stage; it rather states that the variation point must not be bound at a later stage.

This binding time may be earlier than the latest binding time. As explained in the previous section, composition of software components can be bound at `PostBuild`, but it is not always desirable or even feasible to do so. In such a case. `bindingTime` should state an earlier binding time.

Also, unlike the latest binding time, which is a *meta model* element and is stated on M2 level, this binding time is a *model* element associated with a variation point and is stated on M1 level.

That is, the binding time of a variation point limits the point at which a *particular* variation point has to be bound, but this binding time is again constrained by the *latest binding time*.

[2]The attribute is named `bindingTime` and is located at the `ConditionByformula` element of a variation point. For an `AttributeValueVariationPoint`, it is contained in the attribute `bindingTime`.

2.11.3 Defining Variants

A variant is almost always more than a single variant point or a single system constant. Typically, a variant is a list of value assignments to system constants of postbuild variant conditions. In an AUTOSAR model, such a list is represented by the class `PredefinedVariant`.

Similarly, an `EvaluatedVariant` is a set of `PredefinedVariant`s that are known to work (or not to work) for a certain element of the metamodel, for example a specific software component. Evaluated variants may be used to exchange information about known variants between different vendors, for example to document which variants of a software component have been tested and are known to work. This information is necessary because there is a extremely high number of *possible* variants, but only a very small subset of them are feasible.

The set of system constants that are contained in a `PredefinedVariant` usually affect a number of variation points, which are at different locations in the model and have different binding times.

Hence, a predefined variant cannot be directly associated with a specific location in the metamodel, or a certain binding time. On the contrary, a `PredefinedVariant` is used for several metamodel elements and at different binding times.

2.11.4 Choosing Variants

Whether a variation point is included in a system or not is determined by a one or more variables. If the binding time of a variation point is anywhere from `SystemDesignTime` to `LinkTime`, then the variation point contains an expression that is based on system constants. If this expression evaluates to true, then the variation point is included in the system. `PostBuild` uses a simplified scheme that allows only a single comparison with a `PostBuildVariantCriterion` (technically, an `ARElement`).

So, a variant is *chosen* as soon as the values for the respective system constants or postbuild variant conditions have been determined. This is usually done by selecting a `PredefinedVariant`, which contains the respective values. This selection must obviously happen before a variation point is bound. But, it does not need to happen *immediately* before a variation point is bound.

For example, the system constants that determine a `PreCompileTime` variation point may already have been chosen at `SystemDesignTime`, but the actual binding has to be delayed to `PreCompileTime` because of a dependency on another software components that have the binding time `PreCompileTime`, as described in Section 2.11.2.2.

Furthermore, since `PredefinedVariant` spans several variation points, which may have different binding times, some might have a binding time (latest or even actual) immediately after the `PredefinedVariant` has been chosen, and the others might have a later binding time.

Finally, the decision to go for a particular variant is often tied to vendor specific processes that follow their own timeline.

Hence, the time at which a particular variant is chosen is often not the same as the time when the associated variation points are bound. In summary, a variant must be chosen some time before it is bound, but the actual time when this is happening is not determined by AUTOSAR, and is also quite vendor specific.

2.11.5 Tasks and Binding Times

We do not assign concrete binding times to methodology tasks for the follwing reasons.

First, a task as defined by the methodology usually affects more than one model element. These elements may have latest different binding times in the metamodel. Moreover, has we have seen in Section+ 2.11.2.2, the actual binding time often differs from the latest binding time. Hence, it cannot be deduced from the AUTOSAR methodology and the metamodel alone which specific binding times are associated with specific task.

Second, as we have shown in Sections 2.11.3 and 2.11.4, variants have to be defined and chosen before the binding of their associated model elements takes place, but the time at which this happens cannot be prescribed or fixed.

That said, there are certain types of tasks for which a binding time can be indicated. These types of tasks include:

- Any task that works on the model may bind variation points that have the binding time `SystemDesignTime`.
- Any task that *generates* code needs to bind open variation points that have the binding time `CodeGenerationTime`. All variation points with earlier binding times must have been bound by then.
- Similarly, any task that *compiles* code needs to bind open variation points that have the binding time `PreCompileTime`. All variation points with earlier binding times must have been bound by then.

  At this time, the *values* for `PostBuildVariantCondition`s of variation points must also be bound. These values have a latest binding time of `PreCompileTime`[3].

In all cases, the system constants that are needed by the condition of a variation point obviously must be defined before the variation point is bound.

[3] The variation point is still PostBuild: the `PostBuildVariantCondition` is fixed at `PreCompileTime`, but the comparison with the associated `PostBuildVariantCriterion` occurs at `PostBuildVariantCriterion`. See the Generic Structure Template [7] for details

3 Methodology Library

3.1 Common Elements

This chapter contains the definition of work products and tasks used in several areas of AUTOSAR development. For the definition of the relevant meta-model elements refer to [7].

3.1.1 Work Product Kinds

Category (Work Product Kind)	**AUTOSAR XML**
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Product Kinds
Brief Description	
Description	The work products conform to the Autosar XML schema

Table 3.1: AUTOSAR XML

Category (Work Product Kind)	**Binary**
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Product Kinds
Brief Description	
Description	The work products that are stored in a machine readable format such as object code or an executable.

Table 3.2: Binary

Category (Work Product Kind)	**Code**
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Product Kinds
Brief Description	
Description	The following are human readable work products that conform to a defined programming language syntax, such as C or Java.

Table 3.3: Code

Category (Work Product Kind)	**Delivered**
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Product Kinds
Brief Description	

Description	These are collections of Delivered Work Products. They form the basis of exchange between organizations.

Table 3.4: Delivered

Category (Work Product Kind)	**Text**
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Product Kinds
Brief Description	
Description	The following are human readable work products that are stored as plain text, rich text, PDF, etc.

Table 3.5: Text

3.1.2 Tasks

3.1.2.1 Add General Documentation

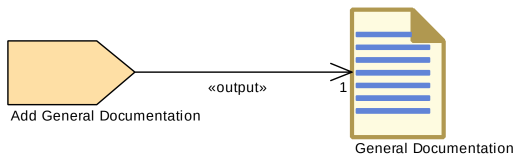

Figure 3.1: Add General Documentation

Task Definition	**Add General Documentation**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description			
Description	Add General Documentation to work products (AR_MET_REQ069)		
Relation Type	***Related Element***	***Mul.***	***Note***
Produces	General Documentation	1	

Table 3.6: Add General Documentation

3.1.2.2 Define Admin Data

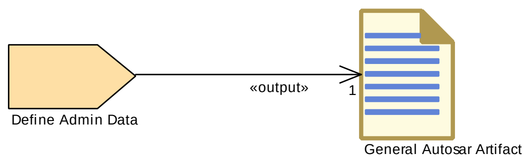

Figure 3.2: Define Admin Data

Task Definition	**Define Admin Data**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description	Generic task to define admin data of an Identifiable within an AUTOSAR artifact.		
Description	Generic task to define administration data (metamodel element AdminData) of an Identifiable within an AUTOSAR artifact. Note that administration data can be defined on several levels, namely for the top-level package of a General Autosar Artifact, but also for sub-packages and for other Identifiables within the XML description. Admininistration data include versioning information of the model element via the meta-class DocRevision, and the aggretation of user specific data via so-called special data groups, meta-class Sdg. For more details on the administration data content see AUTOSAR_TPS_GenericStructureTemplate.pdf.		
Relation Type	***Related Element***	***Mul.***	***Note***
Produces	General Autosar Artifact	1	

Table 3.7: Define Admin Data

3.1.2.3 Define Alias Names

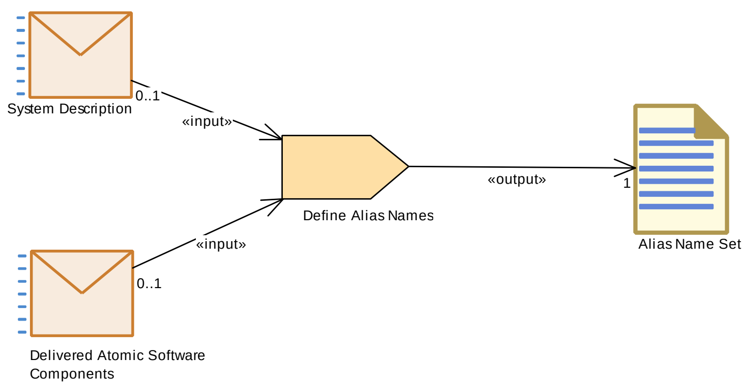

Figure 3.3: Define Alias Names

Task Definition	**Define Alias Names**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description	Define a set of alias names for AUTOSAR model elements.		
Description	The usual mechanism for defining global names for nested elements within an AUTOSAR XML model is the Flat Map. However in the cooperation with non-AUTOSAR tools, there are uses cases which require additional alias names which can be defined by this task. It can be applied on System and on ECU level as well. Possible use cases are for example: • The names defined by an ECU Flat Map, System Flat Map or Partial Flat Map shall be superseded when used by an external tool (e.g. in order to use a more general string format). • Resolve name conflicts for elements which cannot be referred in the context of a Flat Map (e.g. for elements directly defined in the scope of ARPackages, like System Constants to be displayed by A2L tools).		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	Delivered Atomic Software Components	0..1	Needed for definition of alias names in the scope of delivered software components.
Consumes	System Description	0..1	Needed for definition of alias names with system, system extract or ECU scope, depending of the role of the System Description.
Produces	Alias Name Set	1	

Table 3.8: Define Alias Names

3.1.2.4 Evaluate Variant

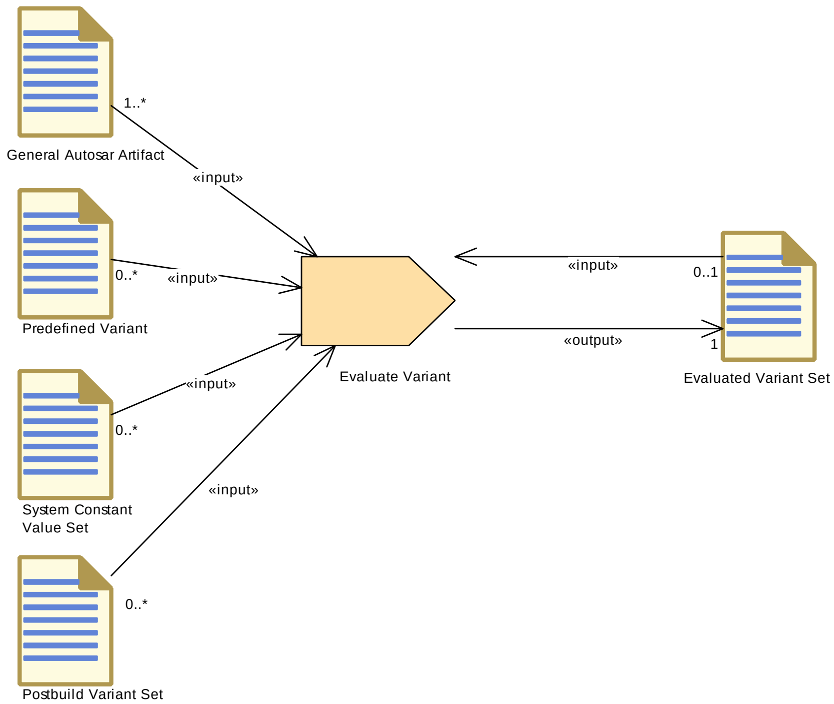

Figure 3.4: Evaluate Variant

Task Definition	**Evaluate Variant**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description	Document the evaluation of variants in the software description.		
Description	Create or modify an Evaluated Variant Set in order to document the outcome of an evaluation of particular variants. This namely means setting the "approval status" in relation to a given set of PredefinedVariants and a given set of model elements (e.g. a particular Software Component) which were evaluated. This is a general task which can be applied on different levels, therefore the input is modeled as General Autosar Artifact.		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	General Autosar Artifact	1..*	
Consumes	Evaluated Variant Set	0..1	
Consumes	Postbuild Variant Set	0..*	
Consumes	Predefined Variant	0..*	
Consumes	System Constant Value Set	0..*	
Produces	Evaluated Variant Set	1	

Table 3.9: Evaluate Variant

3.1.2.5 Define Memory Addressing Modes

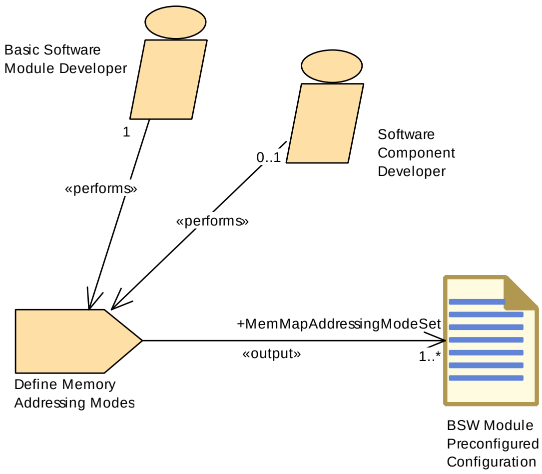

Figure 3.5: Define Memory Addressing Modes

Task Definition	**Define Memory Addressing Modes**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description			
Description	Define the compiler specific configuration used in a later task to generate the "pragmas" in memory mapping header files. The output (container MemMapAddressingModeSet) is treated as pre-configured configuration values for the "module" memmap, because it can be prepared independently from the configuration for a specific integration project.per compiler platform		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Basic Software Module Developer	1	
Performer	Software Component Developer	0..1	
Produces	BSW Module Preconfigured Configuration	1..*	MemMapAddressingModeSet

Table 3.10: Define Memory Addressing Modes

3.1.2.6 Configure Memmap Allocation

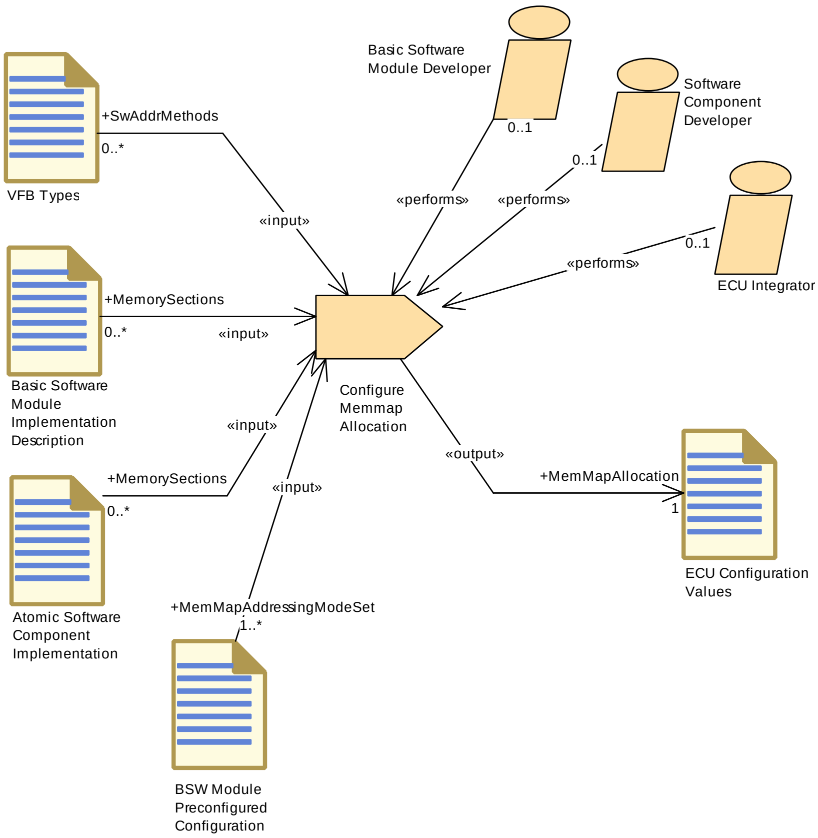

Figure 3.6: Configure Memmap Allocation

Task Definition	**Configure Memmap Allocation**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description			
Description	Configure the ECU Configuration part MemMapAllocation for module "memmap". The output is to be used for generating memory mapping headers during ECU integration as well as for BSW and SWC compiling/linking in local environments. MemMapAllocation defines a mapping between abstract memory sections used in BSW or SWC code and compiler specific configuration elements. The abstract sections are identified via links to SwAddrmethods (generic mapping) resp. MemorySections of the XML input files. The compiler specific configuration is given as a pre-configured configuration for module "memmap" via the container MemMapAddressingModeSet. For more information refer to document ID 128: SWS_MemoryMapping.per build environment		
Relation Type	***Related Element***	***Mul.***	***Note***

Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Module Developer	0..1	
Performer	ECU Integrator	0..1	
Performer	Software Component Developer	0..1	
Consumes	BSW Module Preconfigured Configuration	1..*	MemMapAddressingModeSet: Collection of compiler specific configuration elements for memory allocation.
Consumes	Atomic Software Component Implementation	0..*	MemorySections
Consumes	Basic Software Module Implementation Description	0..*	MemorySections
Consumes	VFB Types	0..*	SwAddrMethods used for the generic mapping. Note that one SwAddrmethod can represent several memory sections.
Produces	ECU Configuration Values	1	MemMapAllocation

Table 3.11: Configure Memmap Allocation

3.1.2.7 Generate BSW Memory Mapping Header

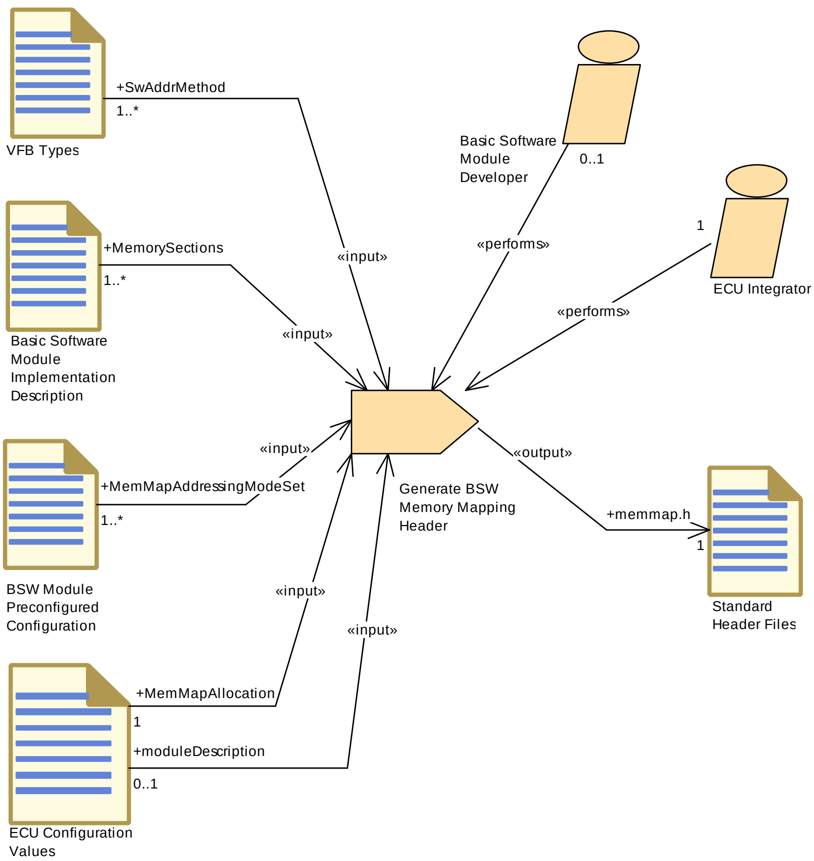

Figure 3.7: Generate BSW Memory Mapping Header

Task Definition	**Generate BSW Memory Mapping Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description			
Description	Generate the file memmap.h for one build environment. This task can be used in ECU scope or with preliminary scope to test BSW modules. Note that memmap.h is compiler specific (#pragma statements). Inputs are: • From VFB Types: Properties of abstract sections given by SwAddrmethods, which in turn are referred by MemorySection as well as by MemMapAllocation • From Basic Software Module Implementation Description, element MemorySection: Names of the individual abstract sections (preprocessor macros) used in the code. • From Preconfigured Configuration for module "memmap": Collection of compiler specific configuration elements. • From ECU Configuration for module "memmap" : MemMapAllocation - This is the concrete mapping for this environment. • From ECU Configuration: Find the list of used BSW modules (EcucValueCollection.ecucValue.moduleDescription)per build environment		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Performer	Basic Software Module Developer	0..1	
Consumes	ECU Configuration Values	1	MemMapAllocation: Mapping of the abstract sections (SwAddressMethods for generic mapping resp. MemorySection Elements for specific mapping) to the compiler specific MemMapAddressingModes.
Consumes	BSW Module Pre-configured Configuration	1..*	MemMapAddressingModeSet: Collection of compiler specific configuration elements for memory allocation.
Consumes	Basic Software Module Implementation Description	1..*	MemorySections defined for a BSW module.
Consumes	VFB Types	1..*	Referred SwAddrMethods
Consumes	ECU Configuration Values	0..1	List of used BSW modules (EcucValueCollection.ecucValue.moduleDescription)
Produces	Standard Header Files	1	one header memmap.h for a given build environment

Table 3.12: Generate BSW Memory Mapping Header

3.1.2.8 Generate SWC Memory Mapping Header

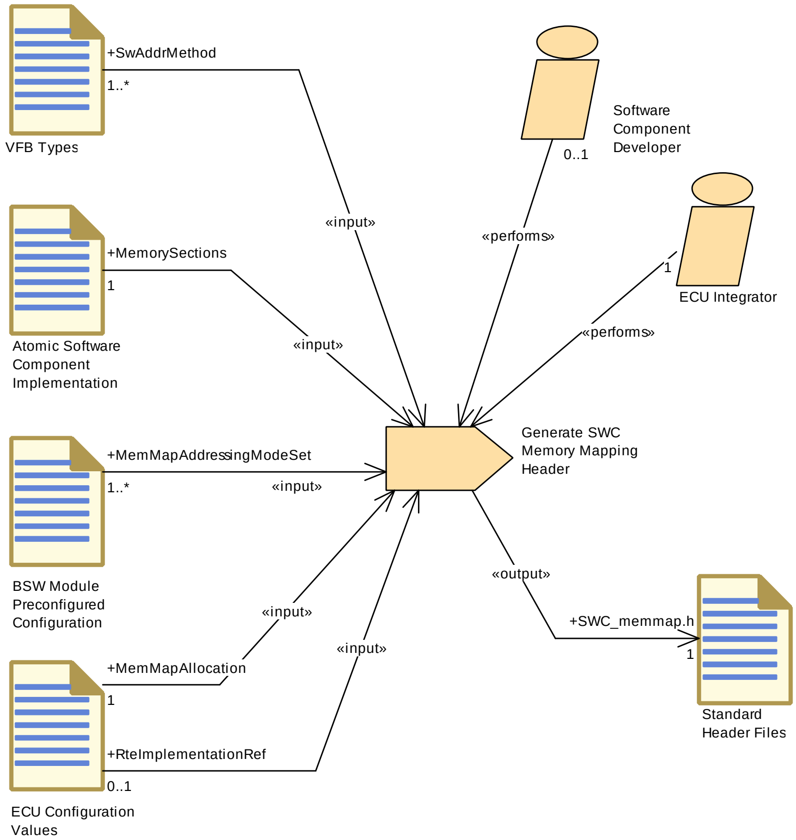

Figure 3.8: Generate SWC Memory Mapping Header

Task Definition	**Generate SWC Memory Mapping Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Tasks		
Brief Description			
Description	Generate the file <SWC>_memmap.h for one build environment and one atomic software component. This task can be used in ECU scope or with preliminary scope to test software component. Note that the generated header file is compiler specific (#pragma statements). Inputs are: • From VFB Types: Properties of abstract sections given by SwAddrmethods, which in turn are referred by MemorySection as well as by MemMapAllocation • From Software Component Implementation, element MemorySection: Names of the individual abstract sections (preprocessor macros) used in the code. • From Preconfigured Configuration for module "memmap": Collection of compiler specific configuration elements. • From ECU Configuration for module "memmap" : MemMapAllocation - This is the concrete mapping for this environment. • From ECU Configuration: Find (optionally) the list of used software component implementations by usage of the RTE ECU Configuration "RteSwComponentType.RteImplementationRef"per component and buld environment		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Performer	Software Component Developer	0..1	
Consumes	Atomic Software Component Implementation	1	MemorySections defined for an atomic software component.
Consumes	ECU Configuration Values	1	MemMapAllocation: Mapipng of the abstract sections (SwAddressMethods for generic mapping resp. MemorySection Elements for specific mapping) to the compiler specific MemMapAddressingModes.
Consumes	BSW Module Preconfigured Configuration	1..*	MemMapAddressingModeSet: Collection of compiler specific configuration elements for memory allocation.
Consumes	VFB Types	1..*	Referred SwAddrMethods
Consumes	ECU Configuration Values	0..1	Existence of SWCs could be identified by usage of the RTE ECU Configuration "RteSwComponentType.RteImplementationRef"
Produces	Standard Header Files	1	one header <SWC>_memmap.h for a given build environment

Relation Type	***Related Element***	***Mul.***	***Note***

Table 3.15: Alias Name Set

3.1.3.3 Evaluated Variant Set

Artifact	**Evaluated Variant Set**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Products		
Brief Description	A set of evaluated variants		
Description	This artifact represents a table defining which ArElements or ArPackages (referrred as "evaluatedElements") are able to support one or more particular variant. It can thus be used to document which variants are support by a certain delivery, e.g. of a software component or of a system. In other words, for a given set of evaluatedElements this element represents a table of evaluated variants, where each PredefinedVariant represents one column. In this column each descendant swSystemConstantValue (part of System Constant Value Set) resp. postbuildVariantCriterionValue (part of Postbuid Variant Set) represents one entry. In a graphical representation each swSystemConstantValueSet / postBuildVariantCriterionValueSet could be used as an intermediate headline in the table column. The Evaluated Variant Set comes with an attribute "approvalStatus". If this is set to "APPROVED" it expresses that the evaluatedElements are known be valid for the given evaluated variants. Note that an evaluatedElement could be another Evaluated Variant Set. This allows to establish a hierarchy of EvaluatedVariantSets.		
Kind	AUTOSAR XML

3.1.3.4 General Autosar Artifact

Artifact	**General Autosar Artifact**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Products		
Brief Description	Describes the meta data for an AUTOSAR artifact.		
Description	This artifact represents the data which are common to all AUTOSAR XML artifacts. Each file starts with the root element AUTOSAR. The content of such an artifact below this root element is organized by packages using the element ARPackage. Packages can be nested. It is important to understand, that the hierarchy defined via packages and other aggregated elements can (in general) span over several XML files, i.e. over several artifacts. That means, if an aggregation is "split" between several files, each file is considered as a separate artifact by the methodology, even if the elements are formally aggregated within the same package. All elements derived from meta-class Identifiable can carry documentation and administrative description based on the element AdminData. Note that ARPackage is itself derived from Identifiable, so there can be AdminData for the top-level package, for sub-packages and for more specific elements (derived from Identifiable) as well. The AdminData among other things contain revision information (including the artifact version) based on the metamodel element DocRevision .

3.1.3.8 Predefined Variant

Artifact	**Predefined Variant**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Products		
Brief Description	Defines a variant predefined for usage in subsequent process steps.		
Description	Defines one variant of a software description for delivery and/or usage in subsequent process steps. The actual definition of all settings which make up this variant is given by attached System Constant Value Set (all settings which are resolved prior to post-build) and/or Postbuid Variant Set (all settings which are resolved after software build). These sets may be part of the same artifact or may be separated artifacts. Via these settings, the actual values which make up a particular variant, are selected.

3.1.3.9 Standard Header Files

Artifact	**Standard Header Files**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Products		
Brief Description	Overall header files to be included by each standardized BSW module, optionally also by Software Component code.		
Description	Overall header files to be included by each standardized BSW module, optionally also by Software Component code. For simplicity of the methodology, these are modeled as one artifact though in practice they are four different files: • MemMap.h - defines a common set of macros in order to define abstract memory sections for code and data in the source code • Std_Types.h - defines a common set of C data types for usage within the basic software, this header includes the following two headers: • Compiler.h - for abstraction of compiler specifics • Platform_Types.h - for abstraction of platform specific types		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Generate BSW Memory Mapping Header	1	one header memmap.h for a given build environment
ProducedBy	Generate SWC Memory Mapping Header	1	one header <SWC>_memmap.h for a given build environment
ConsumedBy	Compile Atomic Software Component	1	
ConsumedBy	Compile BSW Core Code	1	
ConsumedBy	Compile ECU Source Code	1	

Relation Type	***Related Element***	***Mul.***	***Note***
ConsumedBy	Implement a BSW Module	1	
ConsumedBy	Re-compile Component in ECU context	1	
ConsumedBy	Implement Atomic Software Component	0..1	

Table 3.22: Standard Header Files

3.1.3.10 System Constant Value Set

Artifact	**System Constant Value Set**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Work Products		
Brief Description	Set of System Constant Values used to handle variants.		
Description	Set of System Constant Values used to define pre-build variants of the software. Such a set does not necessarily define a variant which is actually used. To define a meaningful variant in the production process, such a set is to be used via reference by artifact PredefinedVariant.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	
AggregatedBy	ECU Extract of System Variant Model	0..*	
AggregatedBy	System Description	0..*	
AggregatedBy	VFB System	0..*	
ParameterInOut	Define System Variants	1	
ParameterInOut	Define Integration Variant	0..*	
ParameterInOut	Define VFB Variants	0..*	
ConsumedBy	Generate BSW Module Prebuild Data Set	1	
ConsumedBy	Generate RTE Prebuild Dataset	1	
ConsumedBy	Generate Component Prebuild Data Set	1..*	

Relation Type	**Related Element**	**Mul.**	**Note**
ConsumedBy	Generate Atomic Software Component Contract Header Files	0..1	
ConsumedBy	Evaluate Variant	0..*	
ConsumedBy	Extract ECU System Variant Model	0..*	
atpUseMetaModelElement	SwSystemconstantValueSet	1	

Table 3.23: System Constant Value Set

3.1.4 Roles

Role	**AUTOSAR Partnership**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	The AUTOSAR Partnership development defines standard artifacts.		
Description			
Relation Type	***Related Element***	***Mul.***	***Note***

Table 3.24: AUTOSAR Partnership

Role	**Basic Software Designer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	Role responsible for the overall design of the Basic Software.		
Description	Role responsible for the overall design of the Basic Software. In contrast to the Basic Software Module Developer he is responsible for the consistency of interfaces and data types between modules.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Define BSW Behavior	1	
Performer	Define BSW Entries	1	
Performer	Define BSW Interfaces	1	
Performer	Define BSW Types	1	
Performer	Generate E2E Protection Wrapper	1	
Performer	Define Vendor Specific Module Definition	0..1	

Table 3.25: Basic Software Designer

Role	**Basic Software Module Developer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	Role responsible to develop and deliver a Basic Software Module.		
Description			
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Compile BSW Core Code	1	
Performer	Create Library	1	
Performer	Define BSW Entries	1	
Performer	Define BSW Interfaces	1	
Performer	Define BSW Module Timing	1	
Performer	Define BSW Types	1	
Performer	Define Memory Addressing Modes	1	
Performer	Develop BSW Module Generator	1	
Performer	Generate BSW Module Prebuild Data Set	1	
Performer	Generate BSWM Contract Header Files	1	
Performer	Implement a BSW Module	1	
Performer	Configure Memmap Allocation	0..1	
Performer	Define Vendor Specific Module Definition	0..1	
Performer	Generate BSW Memory Mapping Header	0..1	
Performer	Measure Component Resources	0..1	

Table 3.26: Basic Software Module Developer

Role	**Calibration Engineer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	The calibration engieer determines the calibration parameters of an ECU.		
Description			
Relation Type	**Related Element**	**Mul.**	**Note**

Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Define VFB Parameter Component	1	
Performer	Generate A2L	1	
Performer	Define VFB Constants	0..1	
Performer	Provide RTE Calibration Dataset	0..1	

Table 3.27: Calibration Engineer

Role	**Certification Agency**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	The certification agency verifies the conformance of artifacts with respect to the standard artifacts defined by the autosar consortium.		
Description			
Relation Type	**Related Element**	**Mul.**	**Note**

Table 3.28: Certification Agency

Role	**ECU Integrator**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	Integrates the complete software on an ECU.		
Description	Integrates the complete software on an ECU, which includes generating necessary code and completing the configuration of all software components and basic software modules.		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Compile ECU Source Code	1	
Performer	Configure Com	1	
Performer	Configure Debug	1	
Performer	Configure Diagnostics	1	
Performer	Configure ECUC	1	
Performer	Configure IO Hardware abstraction	1	
Performer	Configure MCAL	1	
Performer	Configure Mode Management	1	
Performer	Configure NvM	1	
Performer	Configure OS	1	
Performer	Configure RTE	1	
Performer	Configure Watchdog Manager	1

Performer	Connect Service Component	1	
Performer	Create Library	1	
Performer	Create Service Component	1	
Performer	Define ECU Timing	1	
Performer	Define Integration Variant	1	
Performer	Extract the ECU Communication	1	
Performer	Generate BS W Configuration Code	1	
Performer	Generate BSW Memory Mapping Header	1	
Performer	Generate Base Ecu Configuration	1	
Performer	Generate ECU Executable	1	
Performer	Generate Local M C Data Support	1	
Performer	Generate OS	1	
Performer	Generate RTE	1	
Performer	Generate RTE Postbuild Dataset	1	
Performer	Generate RTE Prebuild Dataset	1	
Performer	Generate SWC Memory Mapping Header	1	
Performer	Generate Scheduler	1	
Performer	Measure Resources	1	
Performer	Provide RTE Calibration Dataset	1	
Performer	Configure Memmap Allocation	0..1	
Performer	Extend Topology	0..1	
Performer	Extract ECU System Timing	0..1	
Performer	Extract ECU System Variant Model	0..1	
Performer	Extract ECU Topology	0..1	

Relation Type	Related Element	Mul.	Note
Performer	Flatten Software Composition	0..1	
Performer	Generate Component Header File in Vendor Mode	0..1	
Performer	Generate or Adjust ECU Flat Map	0..1	
Performer	Map Software Component to BS W	0..1	
Performer	Measure Component Resources	0..1	

Table 3.29: ECU Integrator

Role	**Software Component Designer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Common Elements::Roles		
Brief Description	Designer of software components and VFB systems.		
Description			
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Add Documentation to the Software Component	1	
Performer	Define Atomic Software Component Internal Behavior	1	
Performer	Define Complex Device Driver Component	1	
Performer	Define E2E Protection Set for Swc	1	
Performer	Define ECU Abstraction Component	1	
Performer	Define VFB Application Software Component	1	
Performer	Define VFB Composition Component	1	
Performer	Define VFB Constants	1	
Performer	Define VFB Interfaces	1	
Performer	Define VFB Modes	1	
Performer	Define VFB Sensor or Actuator Component	1

3.2 Virtual Functional Bus

This chapter contains the definition of work products and tasks used for the development of a VFB system. For the definition of the relevant meta-model elements refer to [4], for the VFB concepts refer to [3].

3.2.1 Tasks

3.2.1.1 Define VFB Top Level

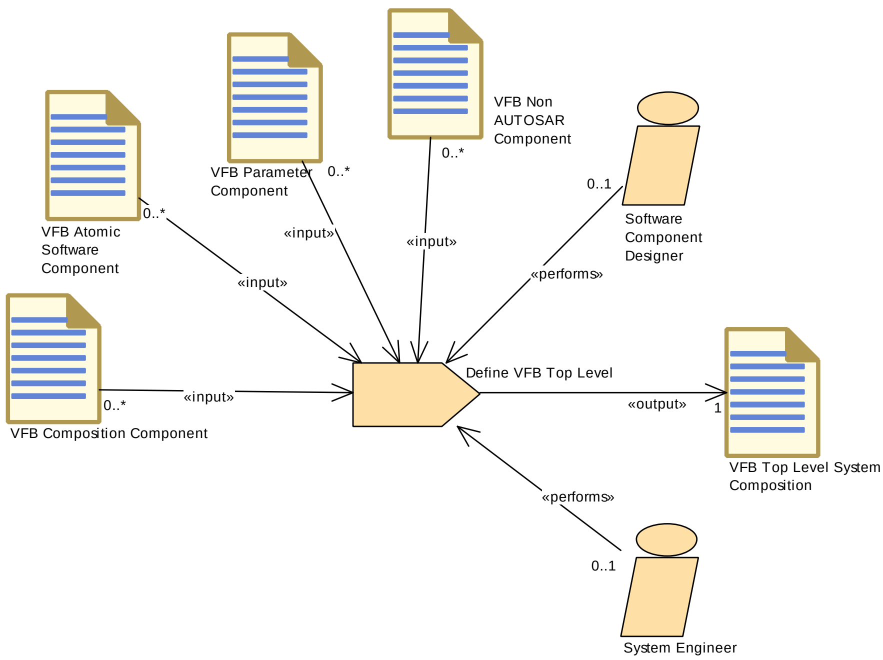

Figure 3.10: Task `Define VFB Top Level`

Task Definition	**Define VFB Top Level**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define the top level VFB composition of a concrete system.		
Description	Define the top level composition of a VFB system.		
Relation Type	*Related Element*	*Mul.*	*Note*

Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Software Component Designer	0..1	
Performer	System Engineer	0..1	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	
Consumes	E2E Protection Set	0..1	
Consumes	VFB Atomic Software Component	0..*	
Consumes	VFB Composition Component	0..*	
Consumes	VFB Modes	0..*	
Consumes	VFB Non AUTOSA R Component	0..*	
Consumes	VFB Parameter Component	0..*	
Produces	VFB Top Level System Composition	1	

Table 3.35: Define VFB Top Level

3.2.1.2 Define VFB Composition Component

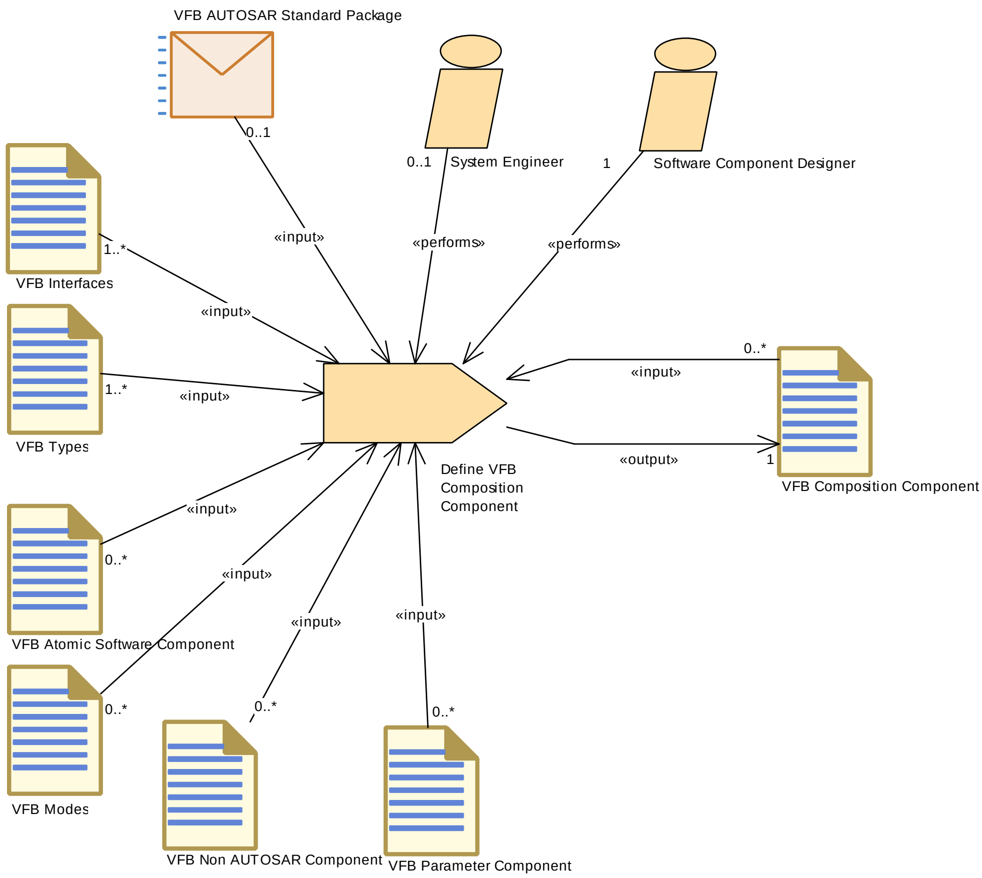

Figure 3.11: Task `Define VFB Composition Component`

Task Definition	**Define VFB Composition Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a Composition of VFB Software Components, i.e. a ComponentTypes which contains other Component Types.		
Description	Define a Composition of VFB Software Components, i.e. a ComponentType which contains other Component Types. Iteration of this task can create a complete VFB system without the Atomic Software Components itself.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Performer	System Engineer	0..1	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	VFB Atomic Software Component	0..*	
Consumes	VFB Composition Component	0..*	
Consumes	VFB Modes	0..*	
Consumes	VFB Non AUTOSA R Component	0..*	
Consumes	VFB Parameter Component	0..*	
Produces	VFB Composition Component	1	

Table 3.36: Define VFB Composition Component

3.2.1.3 Extend Composition

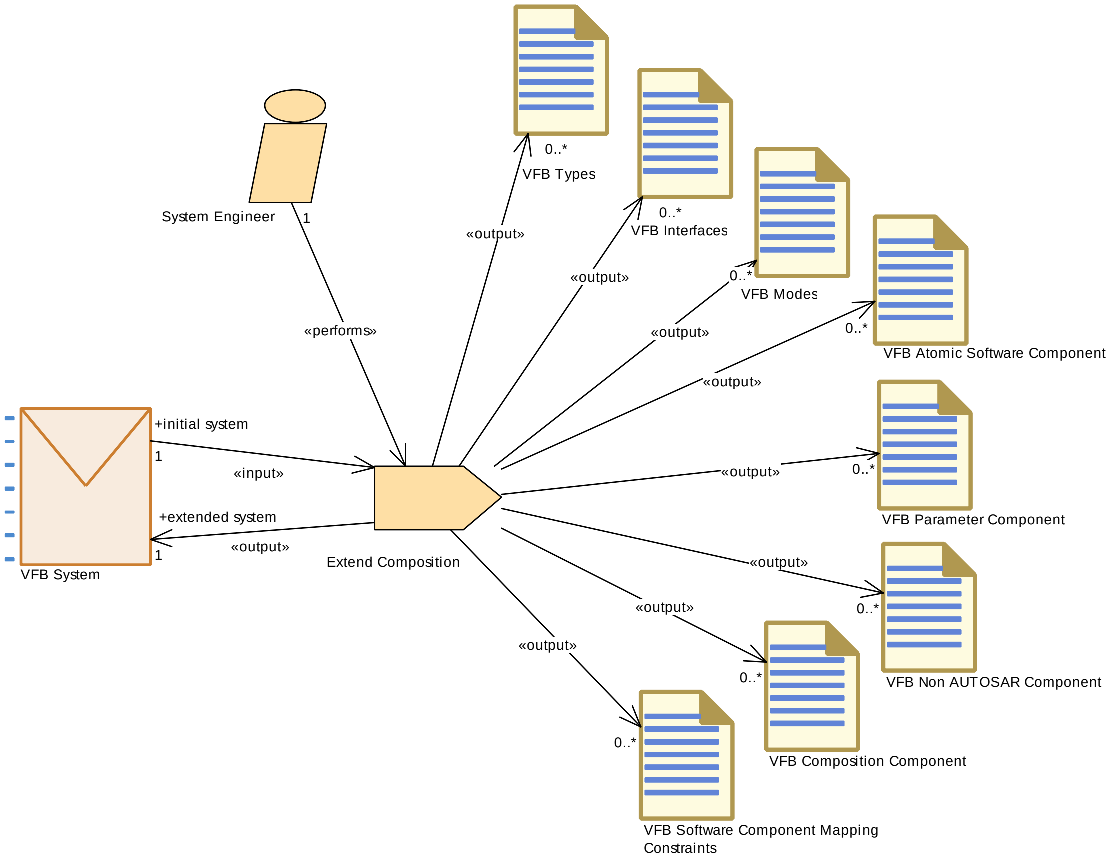

Figure 3.12: Task `Extend Composition`

Task Definition	**Extend Composition**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Extend a software composistion with further compositions and atomic software components.		
Description	This tasks describes the refinement of a delivered VFB System by extending an existing composition with further sub-elements, which could be software components (atomic components as well as compostions), connectors or port groups, plus the related interfaces, data types and modes. The main use case is the refinement of the VFB description of a sub-system: New elements are added but the original delivery is not changed.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	VFB System	1	initial system
Produces	VFB System	1	extended system
Produces	VFB Atomic Software Component	0..*	
Produces	VFB Composition Component	0..*	

Relation Type	*Related Element*	*Mul.*	*Note*
Produces	VFB Interfaces	0..*	
Produces	VFB Modes	0..*	
Produces	VFB Non AUTOSA R Component	0..*	
Produces	VFB Parameter Component	0..*	
Produces	VFB Software Component Mapping Constraints	0..*	
Produces	VFB Types	0..*	

Table 3.37: Extend Composition

3.2.1.4 Define VFB Component Constraints

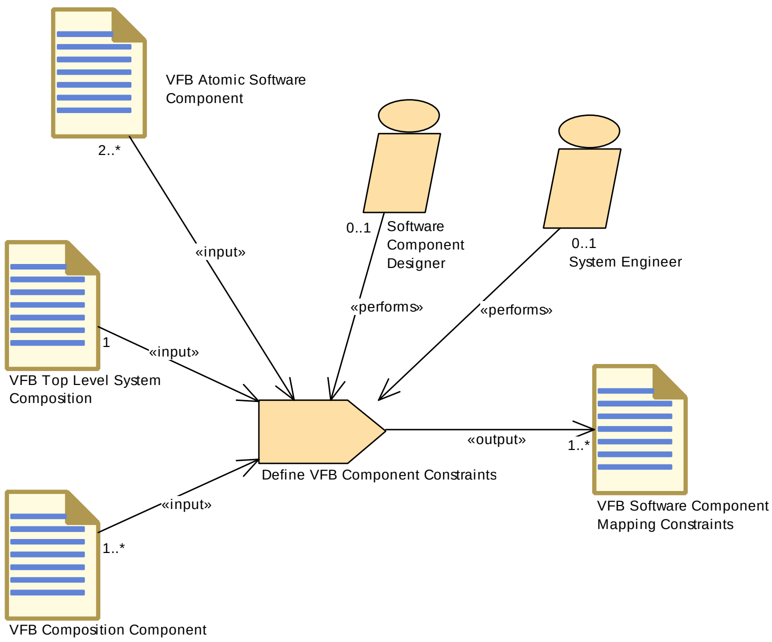

Figure 3.13: Task `Define VFB Component Constraints`

Task Definition	**Define VFB Component Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define which components need to be deployed together, and which need to be deployed separately.		
Description	Define which components need to be deployed together, and which need to be deployed separately, independent of any topology.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Software Component Designer	0..1	
Performer	System Engineer	0..1	

Relation Type	Related Element	Mul.	Note
Consumes	VFB Atomic Software Component	2..*	
Consumes	VFB Top Level System Composition	1	
Consumes	VFB Composition Component	1..*	
Produces	VFB Software Component Mapping Constraints	1..*	

Table 3.38: Define VFB Component Constraints

3.2.1.5 Define VFB Application Software Component

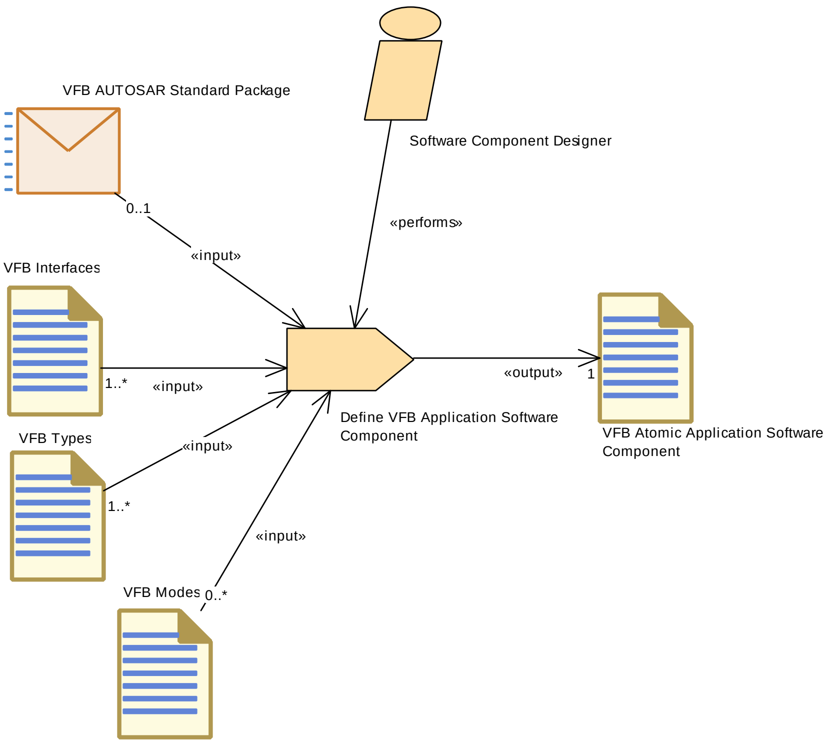

Figure 3.14: Task `Define VFB Application Software Component`

Task Definition	**Define VFB Application Software Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define an ApplicationSoftwareComponentType on VFB level		
Description	Define an ApplicationSoftwareComponentType on VFB level. (i.e. without Internal Behavior and Implementation).		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Software Component Designer	1	
Consumes	VFB Interfaces	1..*	

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	VFB Types	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	VFB Modes	0..*	
Produces	VFB Atomic Application Software Component	1	

Table 3.39: Define VFB Application Software Component

3.2.1.6 Define VFB Sensor or Actuator Component

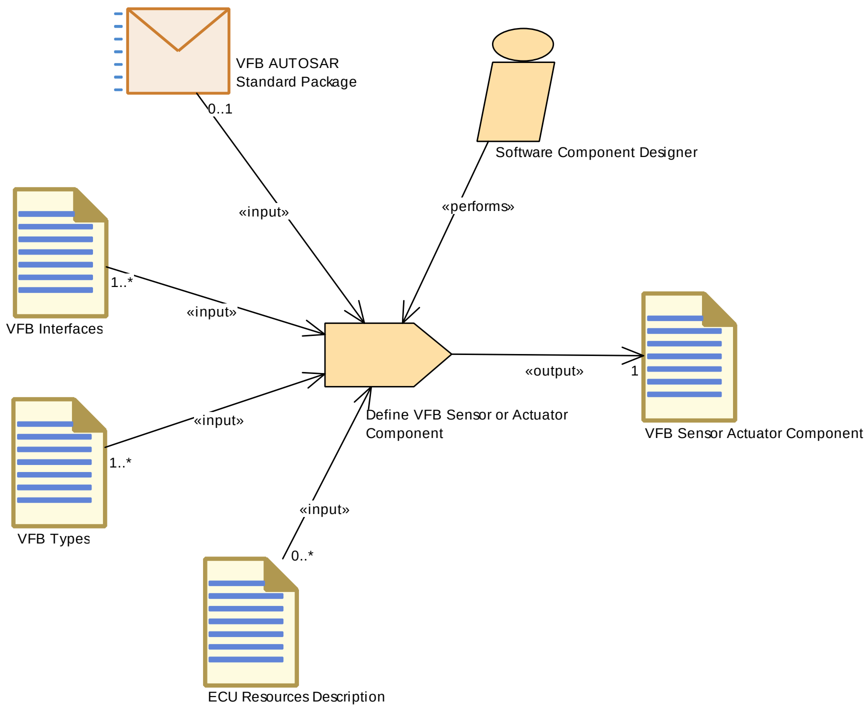

Figure 3.15: Task `Define VFB Sensor or Actuator Component`

Task Definition	**Define VFB Sensor or Actuator Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a VFB Sensor or Actuator Comnponent.		
Description	Define a SensorActuatorComponentType on VFB level. (i.e. without Internal Behavior and Implementation). In addition to defining the ports, references to the required sensor/actuator hardrware shall be specified.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	ECU Resources Description	0..*	
Produces	VFB Sensor Actuator Component	1	

Table 3.40: Define VFB Sensor or Actuator Component

3.2.1.7 Define VFB Parameter Component

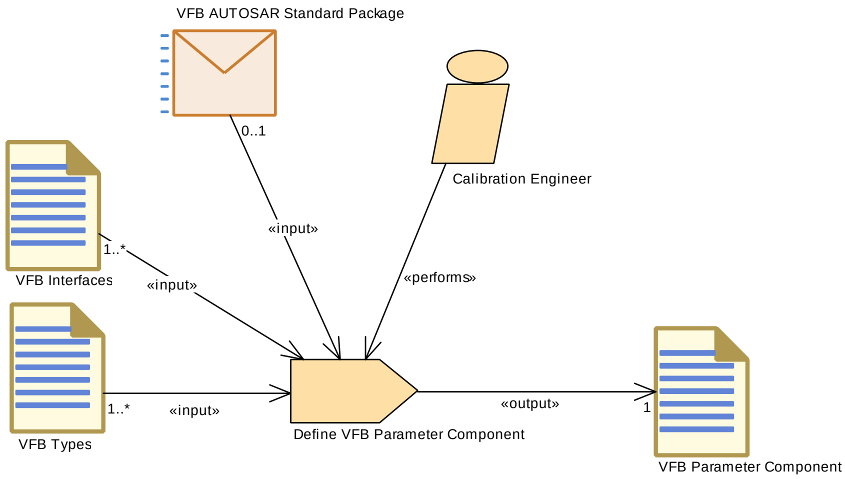

Figure 3.16: Task `Define VFB Parameter Component`

Task Definition	**Define VFB Parameter Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a VFB Parameter Component.		
Description	Define a VFB Parameter Component.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Calibration Engineer	1	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Produces	VFB Parameter Component	1	

Table 3.41: Define VFB Parameter Component

3.2.1.8 Define ECU Abstraction Component

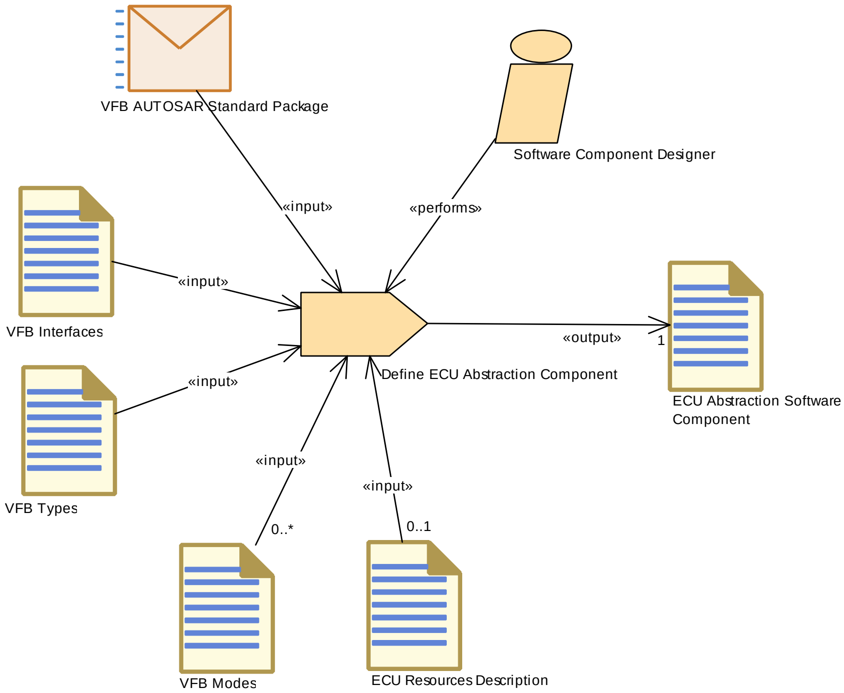

Figure 3.17: Task `Define ECU Abstraction Component`

Task Definition	**Define ECU Abstraction Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define an EcuAbstractionSoftwareComponentType on VFB level.		
Description	Define a EcuAbstractionSoftwareComponentType on VFB level. (i.e. without Internal Behavior and Implementation). In addition to the defining the ports, references to required ECU or processor hardware elements shall be specified.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB AUTOSAR Standard Package	1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	VFB Interfaces	1	
Consumes	VFB Types	1	
Consumes	ECU Resources Description	0..1	
Consumes	VFB Modes	0..*	
Produces	ECU Abstraction Software Component	1	

Table 3.42: Define ECU Abstraction Component

3.2.1.9 Define Complex Device Driver Component

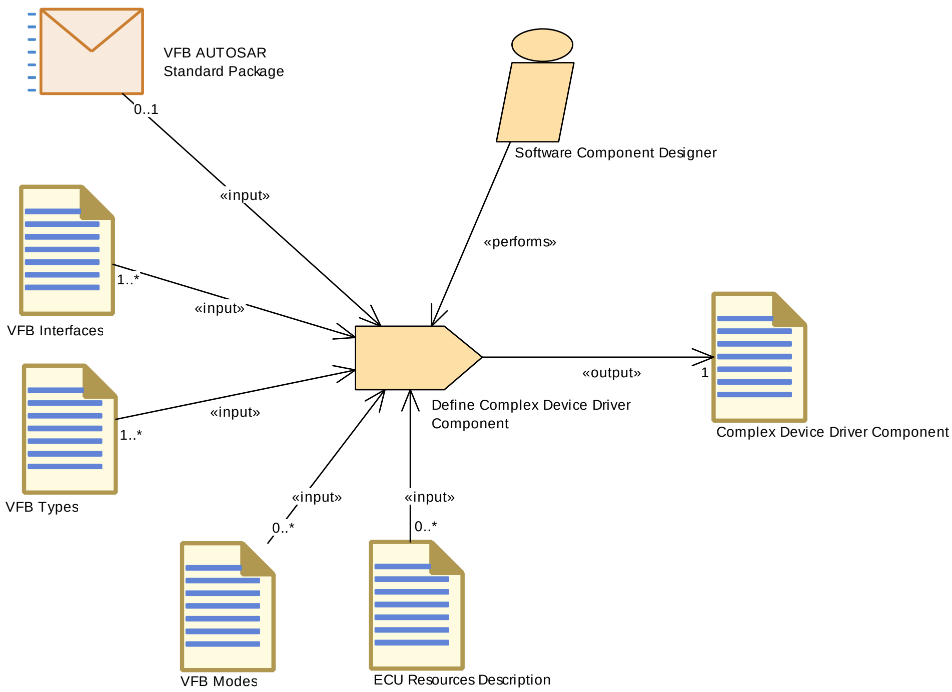

Figure 3.18: Task `Define Complex Device Driver Component`

Task Definition	**Define Complex Device Driver Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a ComplexDeviceDriverSoftwareComponentType on VFB level.		
Description	Define a ComplexDeviceDriverComponentType on VFB level. (i.e. without Internal Behavior and Implementation). In addition to the defining the ports, references to the required ECU or processor hardware elements shall be specified.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	ECU Resources Description	0..*	
Consumes	VFB Modes	0..*	
Produces	Complex Device Driver Component	1	

Table 3.43: Define Complex Device Driver Component

3.2.1.10 Define Wrapper Components to Integrate Legacy Software

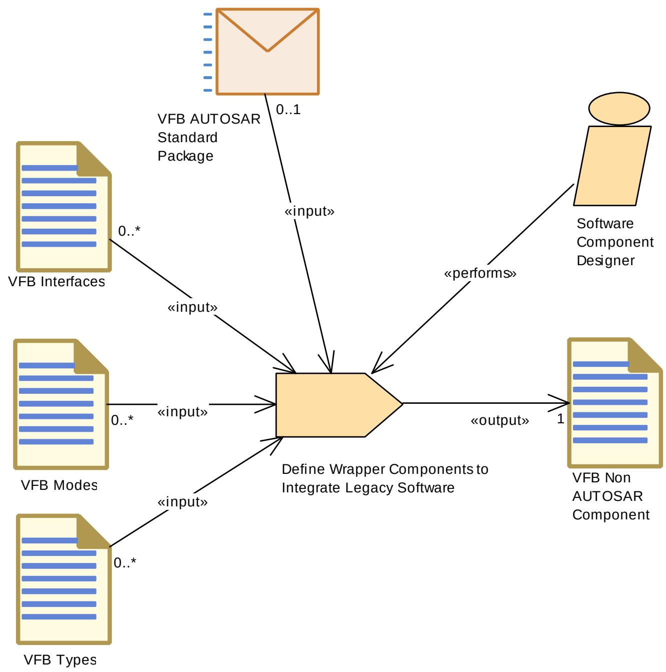

Figure 3.19: Task `Define Wrapper Components to Integrate Legacy Software`

Task Definition	**Define Wrapper Components to Integrate Legacy Software**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a wrapper component used to represent legacy software that is integrated into an AUTOSAR system.		
Description	Define a wrapper component used to represent legacy software that is integrated into an AUTOSAR system. For the VFB system, this mainly means to define the corresponding port interfaces and data elements.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB AUTOSAR Standard Package	0..1	Use port blueprints in order to create ports with standardized application interfaces.
Consumes	VFB Interfaces	0..*	
Consumes	VFB Modes	0..*	
Consumes	VFB Types	0..*	
Produces	VFB Non AUTOSAR Component	1	

Table 3.44: Define Wrapper Components to Integrate Legacy Software

3.2.1.11 Define VFB Interfaces

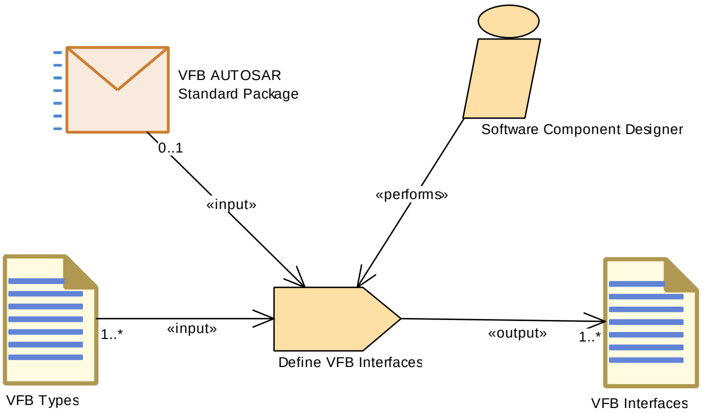

Figure 3.20: Task `Define VFB Interfaces`

Task Definition	**Define VFB Interfaces**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a set of Port Interface required by a system.		
Description	Define a set of Port Interfaces required by a VFB system, to describe the communication of data via SWC ports.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB Types	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	Use standardized Port Interfaces as blueprints (as far as applicable) to create the corresponding elements of the actual project.
Produces	VFB Interfaces	1..*	

Table 3.45: Define VFB Interfaces

3.2.1.12 Define VFB Types

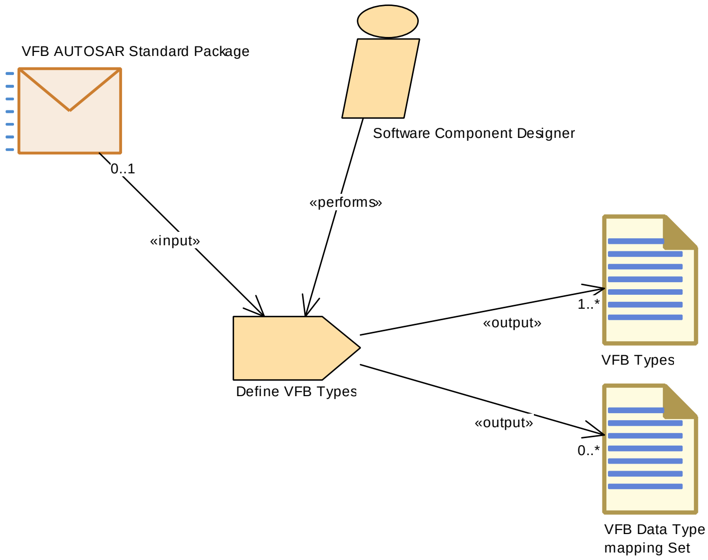

Figure 3.21: Task `Define VFB Types`

Task Definition	**Define VFB Types**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define a set of data types required by a system, but not already defined by AUTOSAR.		
Description	Define a set of Autosar Data Types and related elements as far as visible on the VFB. Standardized types can be used as input in order to copy and refine them. The VFB Types will be used for specifying types of DataElements in Sender-Receiver PortInterfaces and argument/return values of Client-Server PortInterfaces. This task inludes (optionally) also the creation of a VFB Data Type mapping Set between application and implementation data types.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB AUTOSAR Standard Package	0..1	Use standardized elements (e.g. Data Types, Compu Methods) as blueprints (as far as applicable) to create the corresponding elements of the actual project.
Produces	VFB Types	1..*	
Produces	VFB Data Type mapping Set	0..*	

Table 3.46: Define VFB Types

3.2.1.13 Define VFB Modes

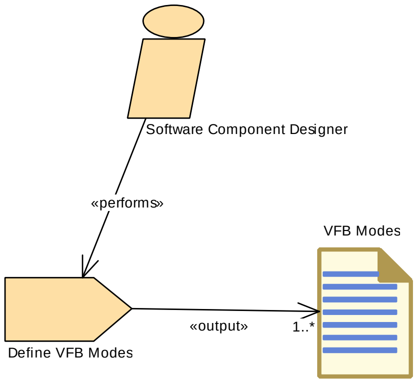

Figure 3.22: Task `Define VFB Modes`

Task Definition	**Define VFB Modes**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define modes that are used by the VFB components.		
Description	Define modes (mode groups and the modes they contain) that are used by the VFB components.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Produces	VFB Modes	1..*	

Table 3.47: Define VFB Modes

3.2.1.14 Define VFB Constants

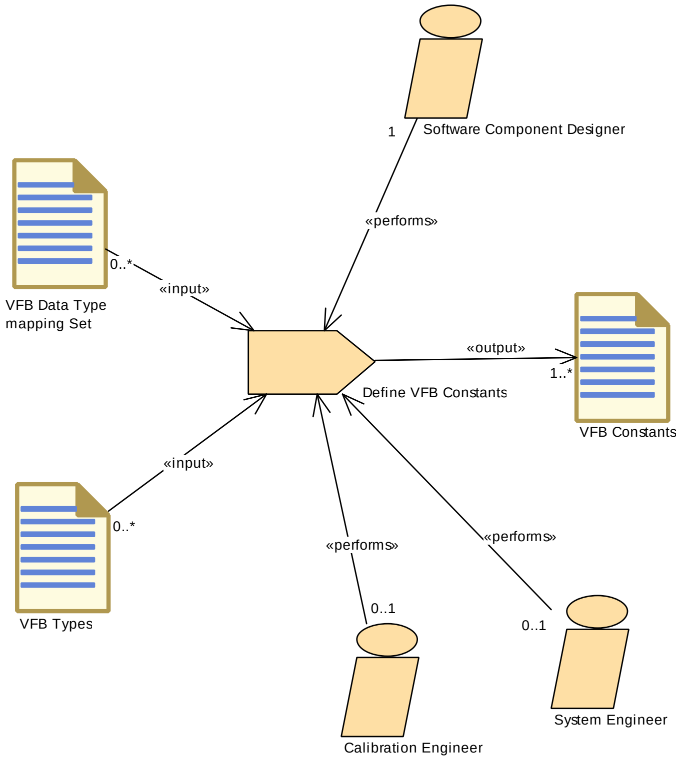

Figure 3.23: Task `Define VFB Constants`

Task Definition	**Define VFB Constants**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define one or more VFB Constants.		
Description	Define one or more VFB Constants as standalone artifact. Such constants can be referred in the specification of inital values at several places in the VFB descrption, such as port interfaces or declaration of local parameters or variables.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Performer	Calibration Engineer	0..1	
Performer	System Engineer	0..1	
Consumes	VFB Data Type mapping Set	0..*	
Consumes	VFB Types	0..*	
Produces	VFB Constants	1..*	

Table 3.48: Define VFB Constants

3.2.1.15 Define VFB Timing

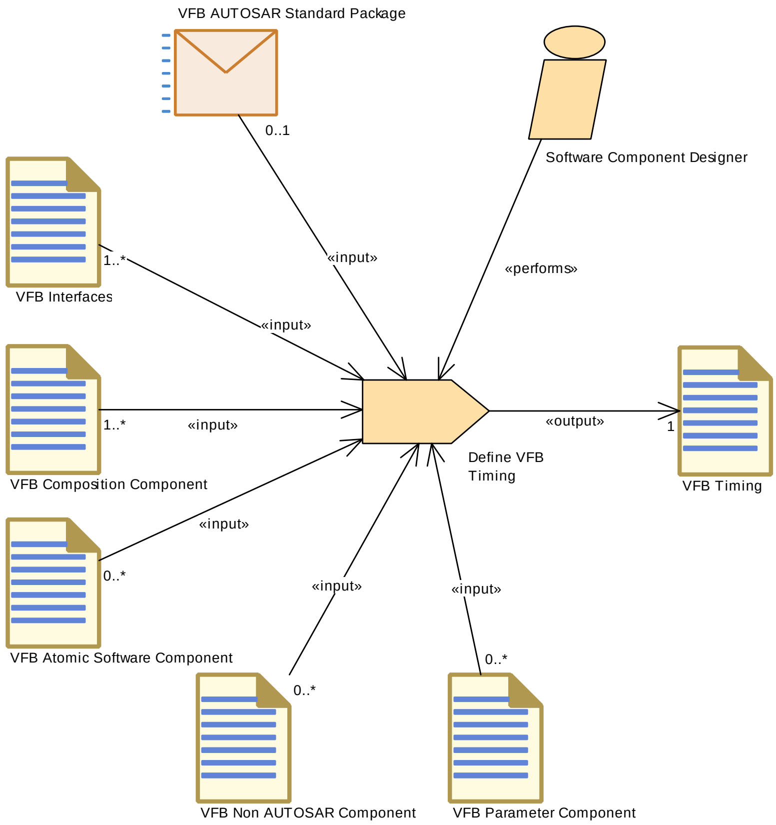

Figure 3.24: Task `Define VFB Timing`

Task Definition	**Define VFB Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define VFB Timing (TimingDescription and TimingConstraints) for an Atomic Software Component or a Composition Component		
Description	Define VFB Timing (TimingDescription and TimingConstraints) for an Atomic Software Component or a Composition Component		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB Composition Component	1..*	
Consumes	VFB Interfaces	1..*	
Consumes	VFB AUTOSAR Standard Package	0..1	
Consumes	VFB Atomic Software Component	0..*	
Consumes	VFB Non AUTOSA R Component	0..*	
Consumes	VFB Parameter Component	0..*	
Produces	VFB Timing	1	

Relation Type	***Related Element***	***Mul.***	***Note***

Table 3.49: Define VFB Timing

3.2.1.16 Define VFB Variants

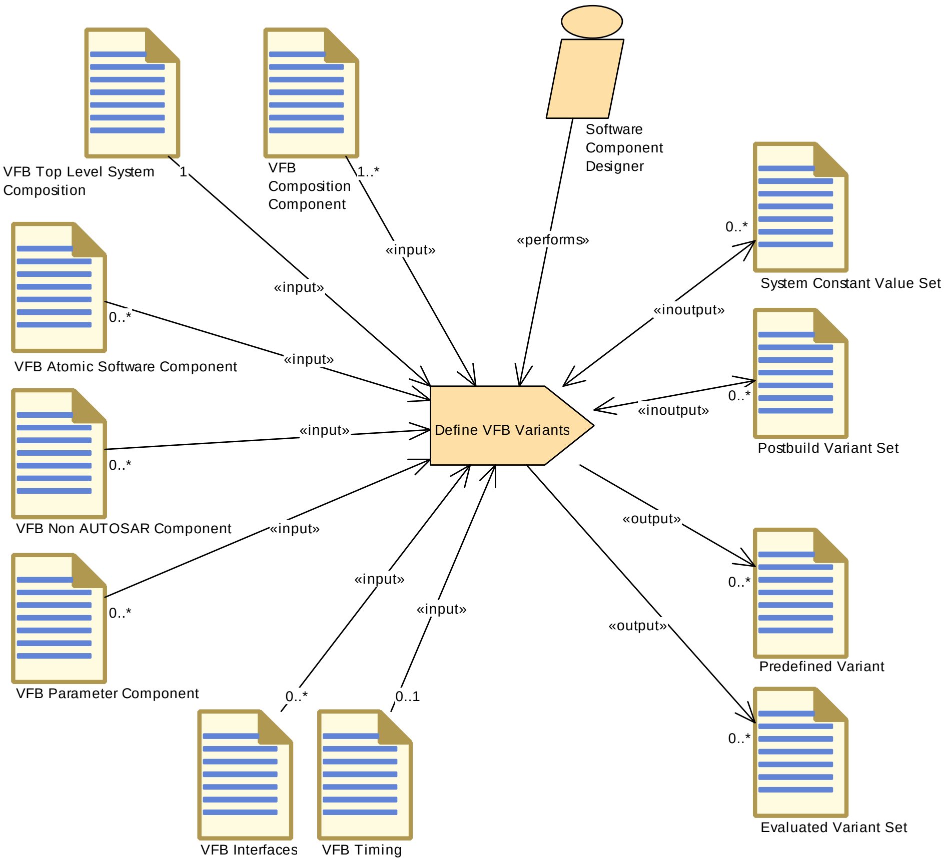

Figure 3.25: Task `Define VFB Variants`

Task Definition	**Define VFB Variants**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description	Define variants for the artifacts of a VFB system.		
Description	Define one or more variants for the artifacts of a VFB system. Defining one variant means creating a Predefined Variant related to the settings used by the VFB elements in scope. To do so, this task can make use of existing System Constant Value Sets and/or Postbuid Variant Sets or define new ones. Several Predefined Variants can be combined to one Evaluated Variant Set.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	VFB Top Level System Composition	1	
Consumes	VFB Composition Component	1..*	
Consumes	VFB Timing	0..1	
Consumes	VFB Atomic Software Component	0..*	
Consumes	VFB Interfaces	0..*	
Consumes	VFB Non AUTOSA R Component	0..*	
Consumes	VFB Parameter Component	0..*	
ParameterInOut	Postbuild Variant Set	0..*	
ParameterInOut	System Constant Value Set	0..*	
Produces	Evaluated Variant Set	0..*	
Produces	Predefined Variant	0..*	

Table 3.50: Define VFB Variants

3.2.1.17 Define E2E Protection Set for Software Components

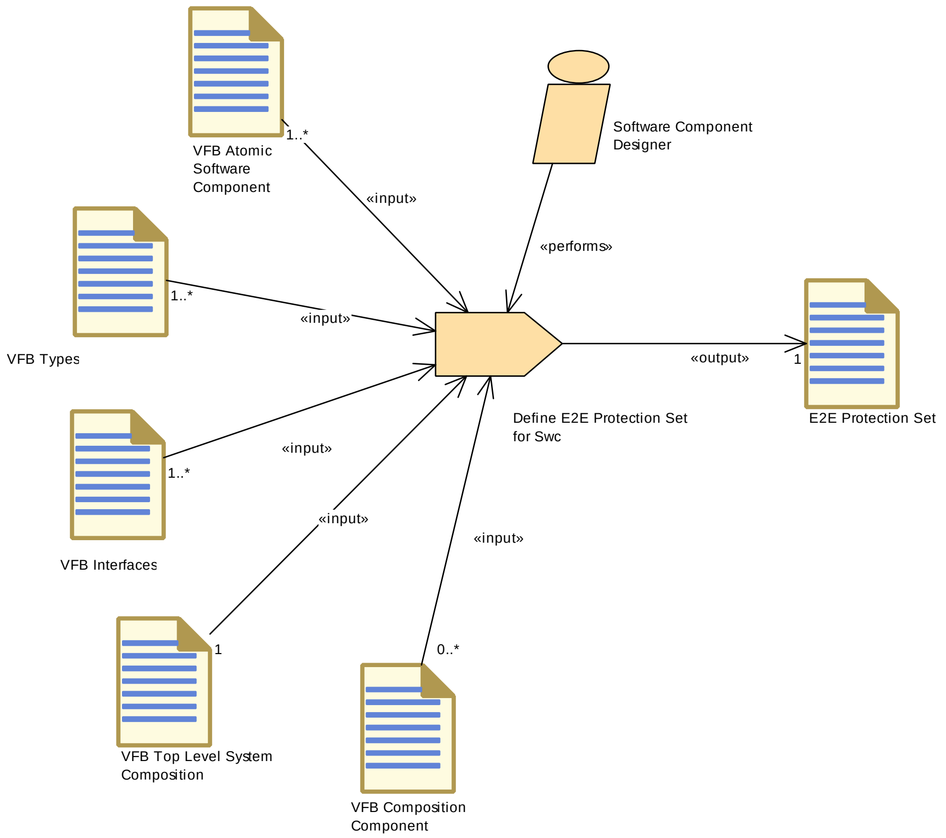

Figure 3.26: Task `Define E2E Protection Set for Software Components`

Task Definition	**Define E2E Protection Set for Swc**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Tasks		
Brief Description			
Description	Define E2E Protection Set for Swc : Define all the constraints at the data level needed to generate the E2E wrapper. These shall be based on different profiles for different levels of safe communication.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Consumes	VFB Top Level System Composition	1	
Consumes	VFB Atomic Software Component	1..*	
Consumes	VFB Interfaces	1..*	
Consumes	VFB Types	1..*	
Consumes	VFB Composition Component	0..*	
Produces	E2E Protection Set	1	

Table 3.51: Define E2E Protection Set for Swc

3.2.2 Work Products

3.2.2.1 VFB System

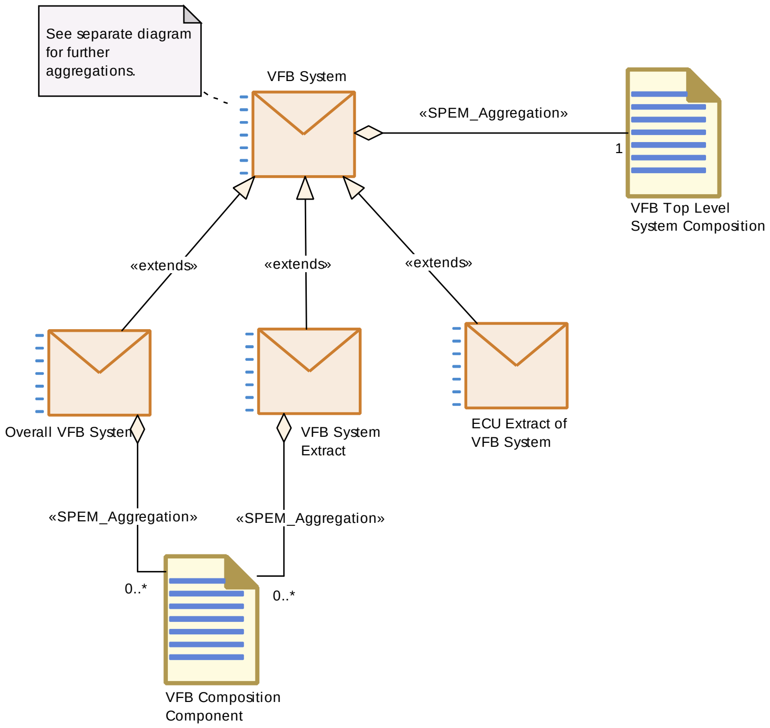

Figure 3.27: Overview on the different roles of Deliverables based on `VFB System`

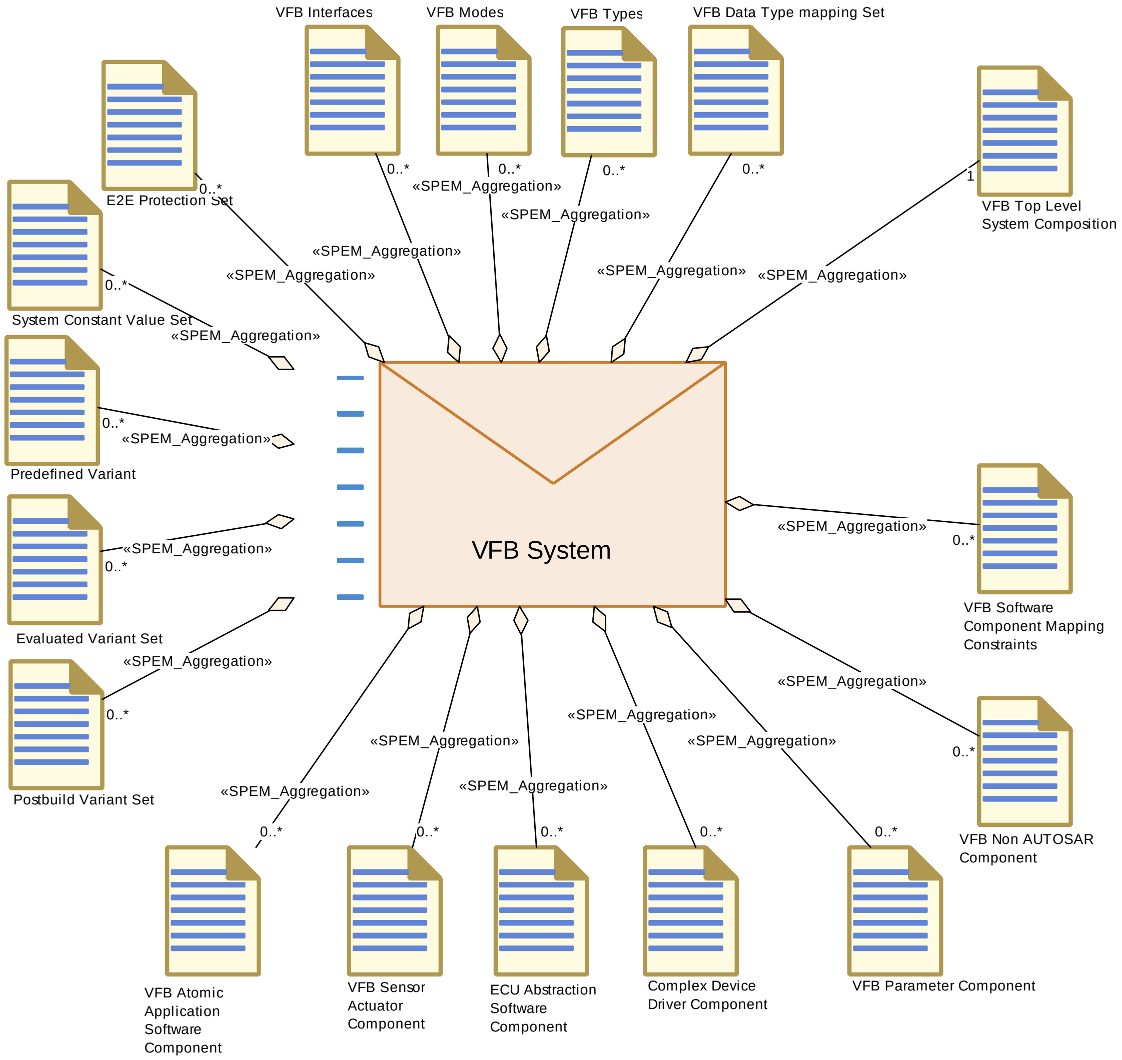

Figure 3.28: Structure of Deliverable `VFB System`

Deliverable	**VFB System**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Complete VFB view of a concrete system.		
Description	Delivery of a VFB view of a concrete system. i.e. the top level composition and all nested compositions and components. This element is the basis for several extensions according to the scope of the VFB which can be an Overall System, a System Extract or an ECU Extract. This deliverable may contain variation points in its XML artifacts which need to be bound in later steps of the methodology. If such variation points are present, the delivered VFB system may optionally include PredefinedVariants in order to predefine variants for later selection and an Evaluated Variant Set. See separate diagram for further aggregations.		
Kind	Delivered		
Extended By	ECU Extract of VFB System, Overall VFB System, VFB System Extract		
Relation Type	***Related Element***	***Mul.***	***Note***
Aggregates	VFB Top Level System Composition	1	
Aggregates	Complex Device Driver Component	0..*

Relation Type	***Related Element***	***Mul.***	***Note***
Aggregates	VFB Types	0..*	
ProducedBy	Extend Composition	1	extended system
ConsumedBy	Define Partial Flat Map	1	Various parts of a given VFB system will be used as input: • Refer to parameters and variables in port interfaces and their data types. • In order to define unique names, also other the component definitions not in the scope of the partial flat map might be checked. • Set a link to the context of the Flat Map, e.g. a VFB Composition.
ConsumedBy	Extend Composition	1	initial system
ConsumedBy	Extract the ECU Communication	1	Need as input in order to set up the Data Mapping.
ConsumedBy	Generate E2E Protection Wrapper	1	Use all elements (like VFB types) that are referred by E2E Protection Set
ConsumedBy	Generate or Adjust System Flat Map	1	

Table 3.52: VFB System

3.2.2.2 Overall VFB System

Deliverable	**Overall VFB System**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description			
Description	Deliverable containing an overall VFB description. It must contain the VFB Top Level System Composition of the complete system.		
Kind			
Extends	VFB System		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	System Configuration Description	1	
AggregatedBy	System Constraint Description	0..1	
Aggregates	VFB Composition Component	0..*	Further compositions below the top level composition.
ProducedBy	Develop a VFB System Description	1	

Relation Type	***Related Element***	***Mul.***	***Note***
ConsumedBy	Develop Application Software	1	The application software needs to refer to the relevant elements of the overall VFB system such as Software Component Types, Port Interfaces and Data Types.
ConsumedBy	Design System	0..1	Usually the System refers to elements of an overall VFB descriptions. But for the description of a legacy system, this input might be empty.
ConsumedBy	Develop System	0..1	Usually the System refers to elements of an overall VFB descriptions. But for the description of a legacy system, this input might be empty.
ConsumedBy	Flatten Software Composition	0..1	Read relevant elements starting from VFB Top Level System Composition in case transformation starts with the full system.
ConsumedBy	Generate or Adjust ECU Flat Map	0..1	Used to set the upstream references in case one starts from a complete system.

Table 3.53: Overall VFB System

3.2.2.3 VFB System Extract

Deliverable	**VFB System Extract**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	The VFB description for the partial system.		
Description	The VFB description for a sub-system. It contains only those software components which belong to this sub-system. It should contain a VFB Top Level System Composition which has unconnected ports reflecting the connection points to the outer system.		
Kind	Delivered		
Extends	VFB System		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	System Extract	1	
Aggregates	VFB Composition Component	0..*	Further compositions below the top level composition.
ConsumedBy	Flatten Software Composition	0..1	Read relevant elements starting from VFB Top Level System Composition in case transformation starts from the system extract.
ConsumedBy	Generate or Adjust ECU Flat Map	0..1	Used to set the upstream references in case one starts from a system extract.

Table 3.54: VFB System Extract

3.2.2.4 VFB Top Level System Composition

Artifact	**VFB Top Level System Composition**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Highest Level Composition consisting of all components that make up the Virtual Function Bus.		
Description	Highest Level Composition consisting of all components and their connectors that make up the VFB System Deliverable. This composition is not allowed to have ports if it represents the top level composition of an Overall VFB System, but it may have unconnected ports (and port groups) if it is at the top of a System Extract or ECU Extract.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	VFB System	1	
ProducedBy	Define VFB Top Level	1	
ConsumedBy	Assign Top Level Composition	1	
ConsumedBy	Define E2E Protection Set for Swc	1

Table 3.55: VFB Top Level System Composition

3.2.2.5 VFB Composition Component

Artifact	**VFB Composition Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Describes a set of VFB CompositionTypes.		
Description	Describes a set of CompositionComponentTypes, which may be nested. A VFB composition aggregates component types to encapsulate and abstract subsystem functionality. Compositions contain instances of components (other compositions and atomic components), as well as the connectors between them.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***

Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	In case the delivered atomic components make up one or more VFB Compositions, the composition description(s) shall be included in the delivery.
AggregatedBy	Overall VFB System	0..*	Further compositions below the top level composition.
AggregatedBy	VFB System Extract	0..*	Further compositions below the top level composition.
ProducedBy	Define VFB Composition Component	1	
ProducedBy	Extend Composition	0..*	
ConsumedBy	Set System Root	1	Only the reference to the artifact is needed

3.2.2.6 VFB AUTOSAR Standard Package

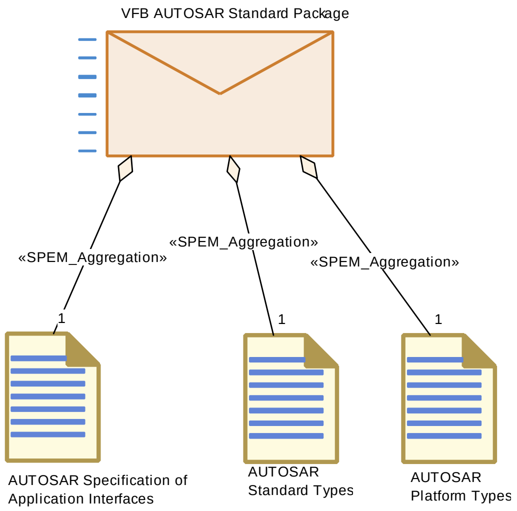

Figure 3.29: Structure of Deliverable `VFB AUTOSAR Standard Package`

Deliverable	**VFB AUTOSAR Standard Package**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Package with standardized AUTOSAR DataTypes, PortInterfaces, ComponentTypes (may include compositions), etc. on VFB level.		
Description	Package with standardized AUTOSAR elements needed on VFB level. This deliverable is released by AUTOSAR and is readonly within the methodology.		
Kind	Delivered		
Relation Type	***Related Element***	***Mul.***	***Note***
Aggregates	AUTOSAR Platform Types	1	
Aggregates	AUTOSAR Specification of Application Interfaces	1	
Aggregates	AUTOSAR Standard Types	1	
ConsumedBy	Define ECU Abstraction Component	1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Develop a VFB System Description	1..*	
ConsumedBy	Define Atomic Software Component Internal Behavior	0..1	Use standardized elements (e.g. Data Types) as blueprints (as far as applicable) to create the corresponding elements of the actual project.
ConsumedBy	Define Complex Device Driver Component	0..1	Use port blueprints in order to create ports with standardized application interfaces.

Relation Type	*Related Element*	*Mul.*	*Note*
ConsumedBy	Define VFB Application Software Component	0..1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Define VFB Composition Component	0..1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Define VFB Interfaces	0..1	Use standardized Port Interfaces as blueprints (as far as applicable) to create the corresponding elements of the actual project.
ConsumedBy	Define VFB Parameter Component	0..1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Define VFB Sensor or Actuator Component	0..1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Define VFB Timing	0..1	
ConsumedBy	Define VFB Types	0..1	Use standardized elements (e.g. Data Types, Compu Methods) as blueprints (as far as applicable) to create the corresponding elements of the actual project.
ConsumedBy	Define Wrapper Components to Integrate Legacy Software	0..1	Use port blueprints in order to create ports with standardized application interfaces.
ConsumedBy	Generate Atomic Software Component Contract Header Files	0..1	
ConsumedBy	Generate Component Header File in Vendor Mode	0..1	
ConsumedBy	Generate Component Prebuild Data Set	0..1

3.2.2.7 AUTOSAR Specification of Application Interfaces

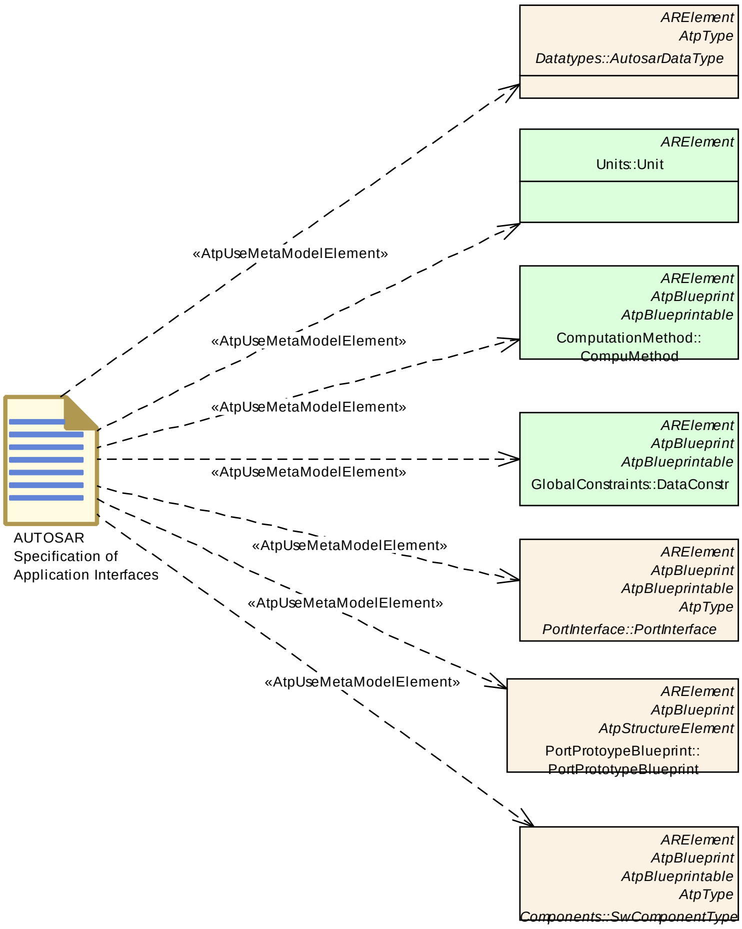

Figure 3.30: The `AUTOSAR Specification of Application Interfaces`

Artifact	**AUTOSAR Specification of Application Interfaces**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Definitions of the AUTOSAR standard appliction interfaces.		
Description	This includes standardized data types, port interfaces, units, port blueprints and example component types (including compositions) for the design of Application Software Components. Note that most of the content is not meant as direct input for defining a VFB system but as so-called blueprints: Blueprints need to be completed with company or project specific elements (e.g. a component type defined as blueprint may need additional ports or a data type defined as blueprint may need additional properties).		
Kind	AUTOSAR XML

Table 3.60: VFB Atomic Application Software Component

3.2.2.10 Complex Device Driver Component

Artifact	Complex Device Driver Component		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	VFB Description of a Complex Device Driver Component.		
Description	The ComplexDeviceDriver Component is a special AtomicSoftwareComponent that has direct access to hardware on an ECU and which is therefore linked to a specific ECU or specific hardware. The ComplexDeviceDriverComponentType introduces the possibility to link from the software representation to its hardware description provided by the ECU Resource Template. It provides (non-standardized) AUTOSAR Interfaces via ports on VFB level.		
Kind	AUTOSAR XML		
Extends	VFB Atomic Software Component

Table 3.61: Complex Device Driver Component

3.2.2.11 ECU Abstraction Software Component

Artifact	**ECU Abstraction Software Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	VFB Description of an ECU Abstraction Component.		
Description	The ECU Abstraction Component is a special Atomic Software Component that sits between a component that wants to access ECU periphery (typically a SensorActuatorComponent) and the Microcontroller Abstraction. It provides (non-standardized) AUTOSAR Interfaces via ports which represent the ECU periphery. The EcuAbstractionComponentType introduces the possibility to link from the software representation to its hardware description provided by the ECU Resource Template. During integration, an ECUAbstractionComponent will be mapped to a BSW module which implements it and which will directly (without RTE) be connected to the Microcontroller Abstraction.		
Kind	AUTOSAR XML		
Extends	VFB Atomic Software Component		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	VFB System	0..*

3.2.2.13 VFB Sensor Actuator Component

Artifact	**VFB Sensor Actuator Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Describes a sensors or actuator component that exist at the VFB Level and represents the physical interface of an actual sensor or actuator hardware element.		
Description	A sensor-actuator software component is an atomic software-component that makes the functionality of a sensor or actuator usable for other software components. That means that the sensor-actuator software component provides to the application software components an interface for the physical values of the sensors and actuators. A sensor-actuator software component is written for a concrete sensor or actuator and uses the ECU abstraction interface. It references the description of the associated hardware element.		
Kind	AUTOSAR XML

Table 3.66: VFB Interfaces

3.2.2.16 VFB Types

Artifact	**VFB Types**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	Data types and related elements that form part of the VFB, but are not standardized by AUTOSAR.		
Description	Description of AutosarDataTypes and related elements (e.g. units, computation methods, etc.) that form part of the VFB, but are not standardized by AUTOSAR. This may also include copies of standardized elements which have been completed with project specific information (e.g. with calibration access information or computation methods). A VFB system can contain several different instances of this artifact, which may fulfill different roles. AutosarDataTypes can come as so-called ApplicationDatatypes or ImplementationDataTypes. This package can contain both kinds but they can also be split into separate artifacts. However, since it is also possible to generate ImplementationDataTypes from ApplicationDataTypes, a VFB system can be completely defined with ApplicationDatatypes only. Note that this work product is meant for use cases, in which a set of data types is maintained as a separate artifact. It is also possible to define particular AutosarDataTypes as part of another artifact, e.g. of VFB Interfaces if the types are closely related to certain port interfaces. In the methodology this artifact stands not only for data type definitions, but also for related elements like addressing methods, units, computation methods, constraints. etc. This is done for simplicity, because these elements are often consumed by the same tasks. Of course these can be treated as separate artifacts in real projects.

3.2.2.20 VFB Software Component Mapping Constraints

Artifact	**VFB Software Component Mapping Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::VFB::Work Products		
Brief Description	A defined constraint on how certain components must be mapped (clustered or separated) to ECUs.		
Description	One or more defined constraints on how certain components must be mapped (clustered, separated or dedicated mapping). This defines constraints to which components need to be mapped to a single ECU, and which must be mapped to separate ECUs, without regard to any particular ECU or topology. Notes: The meta-model element SystemMapping allows to describe a collection of such constraints as one single artifact.

Table 3.73: E2E Protection Set

3.3 System

This chapter contains the definition of work products and tasks used for the development of systems and sub-systems. For the definition of the relevant meta-model elements refer to [8] and [9].

3.3.1 Tasks

3.3.1.1 Set System Root

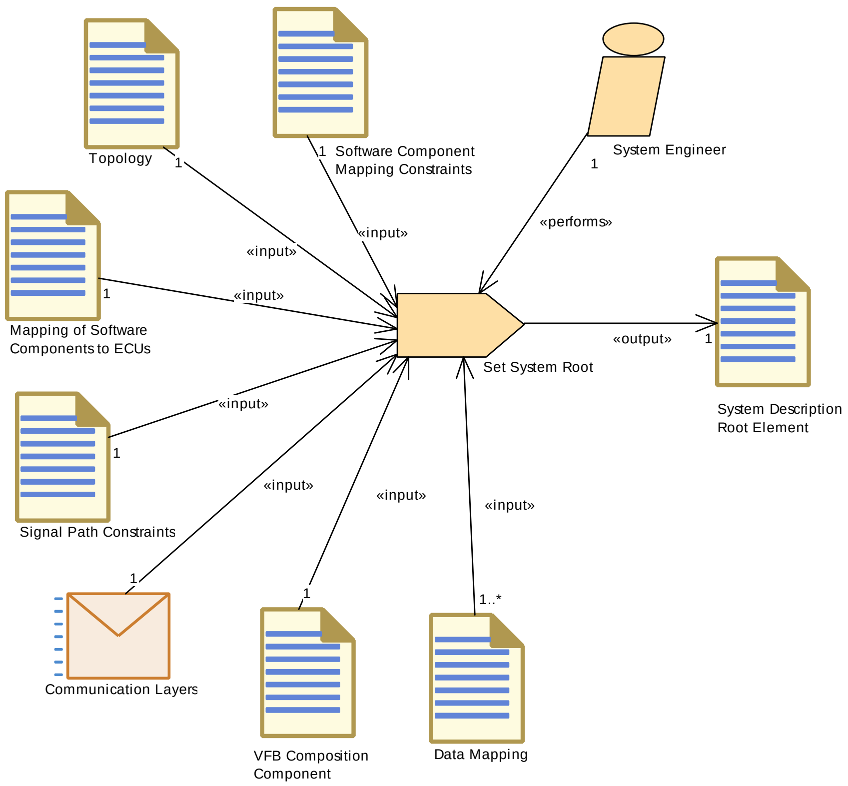

Figure 3.32: Set System Root

Task Definition	**Set System Root**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description			
Description	Set up the root element of a system description.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Communication Layers	1	Only the reference to the artifact is needed
Consumes	Mapping of Software Components to ECUs	1	Only the reference to the artifact is needed

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	Signal Path Constraints	1	Only the reference to the artifact is needed
Consumes	Software Component Mapping Constraints	1	Only the reference to the artifact is needed
Consumes	Topology	1	Only the reference to the artifact is needed
Consumes	VFB Composition Component	1	Only the reference to the artifact is needed
Consumes	Data Mapping	1..*	Only the reference to the artifact is needed
Produces	System Description Root Element	1	Set up the root element, and the links to other artifacts

Table 3.74: Set System Root

3.3.1.2 Assign Top Level Composition

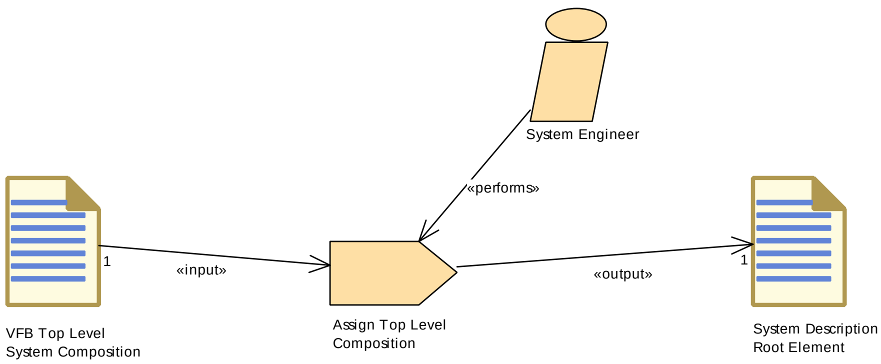

Figure 3.33: Assign Top Level Composition

Task Definition	**Assign Top Level Composition**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description			
Description	Assign a VFB Top Level Composition to the System Root		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	System Engineer	1	
Consumes	VFB Top Level System Composition	1	
Produces	System Description Root Element	1	

Table 3.75: Assign Top Level Composition

3.3.1.3 Define ECU Description

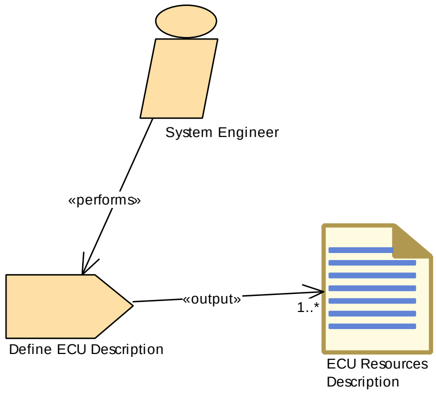

Figure 3.34: Define ECU description

Task Definition	**Define ECU Description**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Define a particular ECU's resources.		
Description	Define a particular ECU's resources by describing Hardware Elements, pins, connections.The HW Elements are the main describing elements of an ECU,e;g processing units, memory, peripherals, sensors and actuators. HW Elements have a unique name and can be identified within the ECU description. HW Elements do not necessarily have to be described on the level of an ECU. It is possible to describe HW Elements as parts of other HW Elements. By this means, a hierarchical description of HW Elements can be created. HW Elements provide HW PinGroups and HW Pins for being interconnected among each others. HW PinGroups allow a rough description of how certain groups of HWPins are arranged. The detailed description can be done using the HW Pins.HW Connections are used to describe connection on several levels:connections between HW Elements, connections between HW PinGroups, connections between HW Pins.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Produces	ECU Resources Description	1..*	

Table 3.76: Define ECU Description

3.3.1.4 Define System Topology

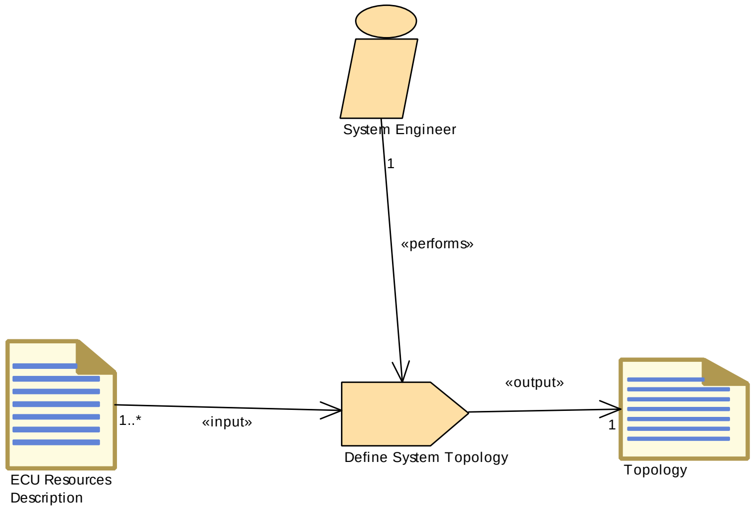

Figure 3.35: Define System Topology

Task Definition	**Define System Topology**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Select the ECUs and how the they are interconnected by networks.		
Description	Define how the ECUs of a system are interconnected by networks.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	ECU Resources Description	1..*	
Produces	Topology	1	

Table 3.77: Define System Topology

3.3.1.5 Define Software Component Mapping Constraints

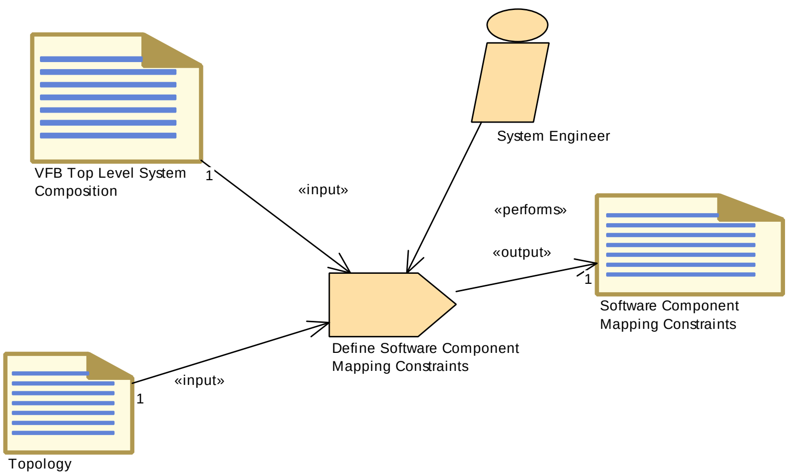

Figure 3.36: Define Software Component Mapping Constraints

Task Definition	**Define Software Component Mapping Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Define Constraints on software components that are clusterred together or separate, and how software components need to be assigned to a particular ECU or not.		
Description	Define constraints on Software Components during the mapping phase. These constraints are described into the System Constraint description. Two constraints express the restrictions that Software Components impose each other when performing the mapping onto the ECUs. In fact, before the mapping process begins, it can be useful to impose the allocation of a predefined set of SW components onto the same ECU, especially if such a set is tightly linked from a functional point of view. In the same way, two critical SW components, performing some kind of redundancy, may be not suitable to run both on the same ECU. Thus, we call these two kinds of mapping constraints, respectively, ComponentClustering and ComponentSeparation. The ComponentClustering constraint (also, clustering) is to be used for expressing that a certain set of SW components (atomic or not) must be mapped (allocated) onto the same ECU. This is some kind of "execute together on same ECU" constraint. The ComponentSeparation constraint (also, separation) is to be used for expressing that two SW components (atomic or not) shall not be mapped (allocated) onto the same ECU. This is some kind of do not execute together on same ECU constraint.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Topology	1	
Consumes	VFB Top Level System Composition	1	
Produces	Software Component Mapping Constraints	1	

Table 3.78: Define Software Component Mapping Constraints

3.3.1.6 Deploy Software Component

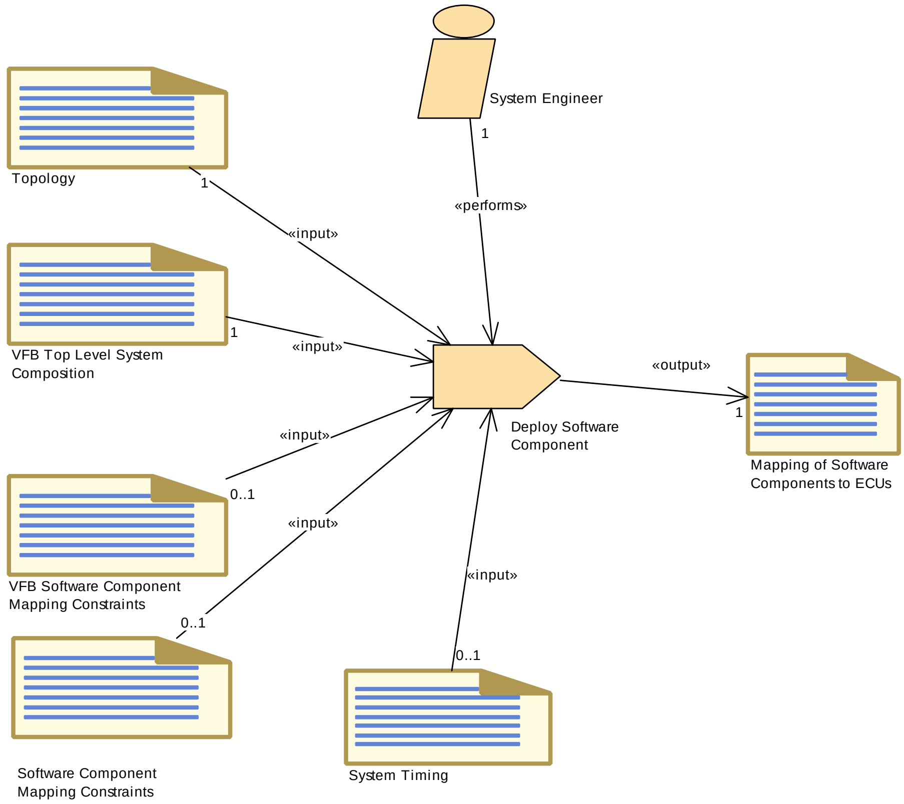

Figure 3.37: Deploy Software Component

Task Definition	**Deploy Software Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Deploy VFB Software Components to an ECU		
Description	Deploy each VFB Software Component to an ECU that will execute the component.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Topology	1	
Consumes	VFB Top Level System Composition	1	
Consumes	Software Component Mapping Constraints	0..1	Constraints defined on the System level
Consumes	System Timing	0..1	
Consumes	VFB Software Component Mapping Constraints	0..1	Constraints defined on the VFB level
Produces	Mapping of Software Components to ECUs	1	

Relation Type	*Related Element*	*Mul.*	*Note*

Table 3.79: Deploy Software Component

3.3.1.7 Generate or Adjust System Flat Map

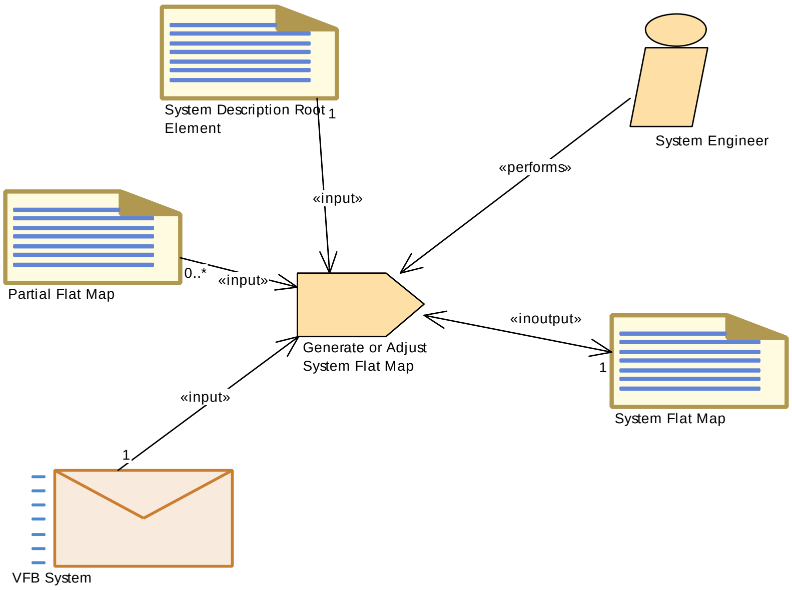

Figure 3.38: Generate or Adjust System Flat Map

Task Definition	**Generate or Adjust System Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Generates and/or adjust the unique names of component prototypes and MCD display data in the scope of system.		
Description	Generates and/or adjust the unique names of component prototypes and MCD display data in the scope of a System or System Extract.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	System Engineer	1	
Consumes	System Description Root Element	1	
Consumes	VFB System	1	
Consumes	Partial Flat Map	0..*	If Partial Flat Maps were delivered along with software components, they must be integrated into the System Flat Map: • The instance refs used in a partial flat map must be taken over and adjusted to the context of the System or System Extract. • Name conflicts have to be resolved if several partial flat maps are merged.

Relation Type	Related Element	Mul.	Note
ParameterInOut	System Flat Map	1	

Table 3.80: Generate or Adjust System Flat Map

3.3.1.8 Derive Communication Needs

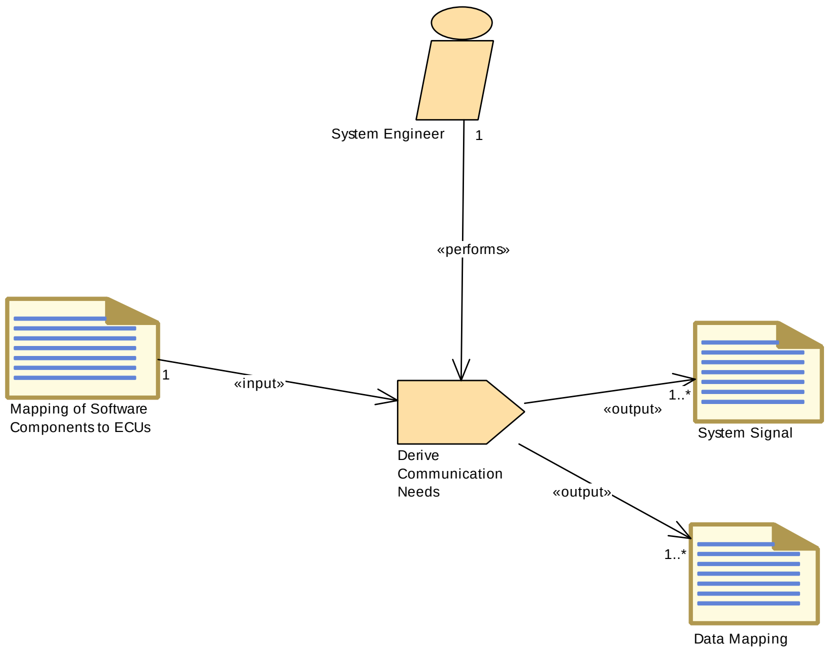

Figure 3.39: Derive Communication Needs

Task Definition	**Derive Communication Needs**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Define the signals used to exchange data & operations needed by software components over a network.		
Description	Define the signals used to exchange data & operations needed by software components over a network.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Mapping of Software Components to ECUs	1	
Produces	Data Mapping	1..*	
Produces	System Signal	1..*	

Table 3.81: Derive Communication Needs

3.3.1.9 Define Signal Path Constraints

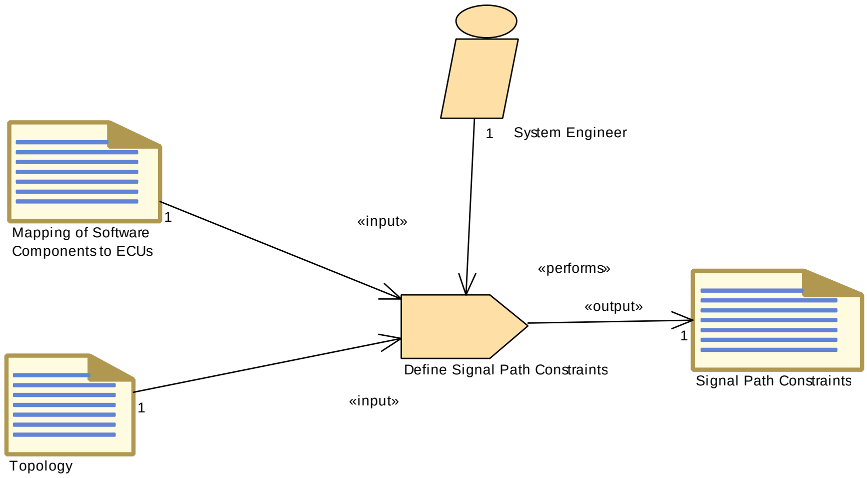

Figure 3.40: Define Signal Path Constraints

Task Definition	**Define Signal Path Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Additional guidelines for the System Generator, which specific way a signal between two Software Components should take in the network without defining in which frame and with which timing it is transmitted.		
Description	Define additional guidelines for the System Generator, which specific way a signal between two Software Components should take in the network without defining in which frame and with which timing it is transmitted.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Mapping of Software Components to ECUs	1	
Consumes	Topology	1	
Produces	Signal Path Constraints	1	

Table 3.82: Define Signal Path Constraints

3.3.1.10 Define System Variants

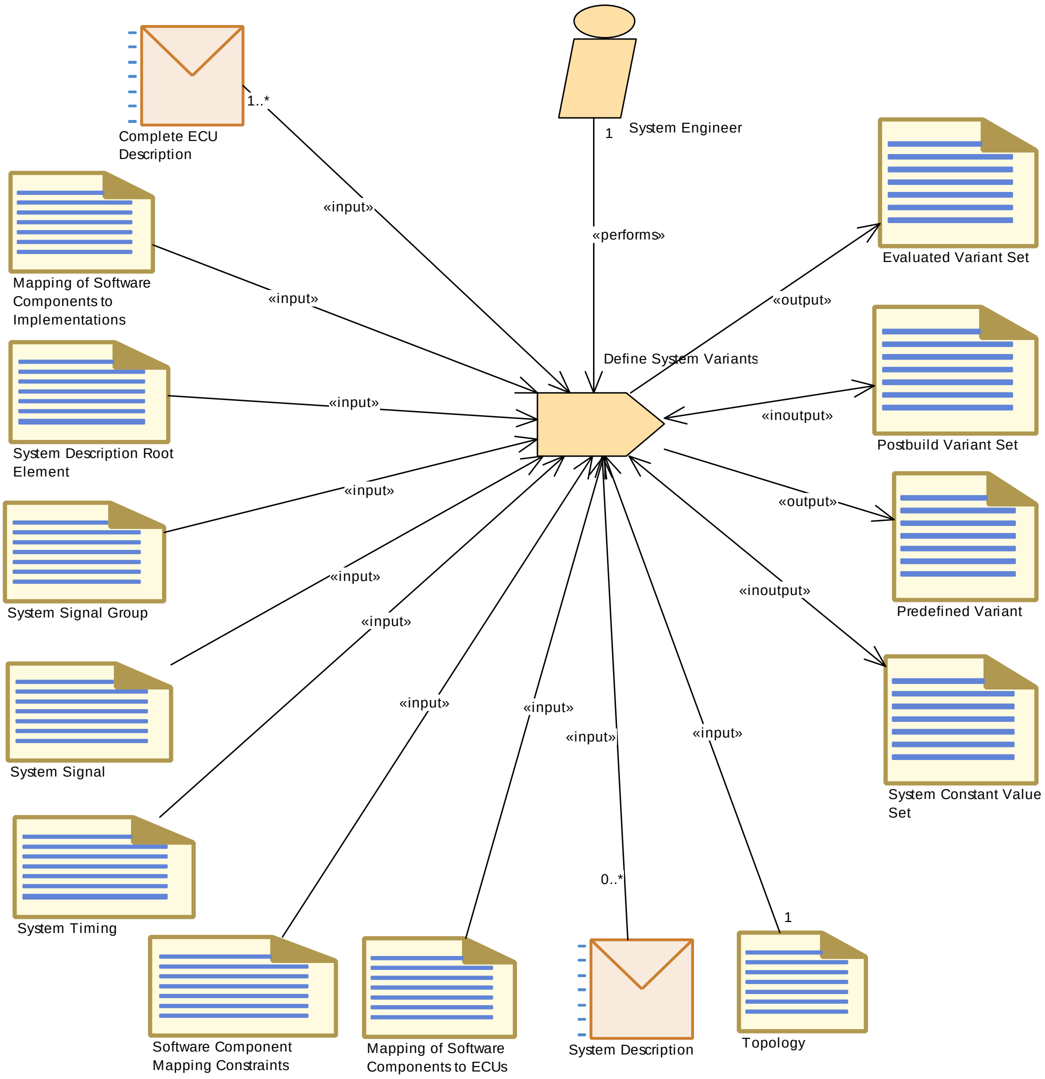

Figure 3.41: Define System Variants

Task Definition	**Define System Variants**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Define variants for the artifacts of a System Description.		
Description	Define variants for the artifacts of a System Description. Definition of a variant means in general to define its conditions and its latest binding time. Therefore one has to create a PredefinedVariant referring to the settings which are used by the system elements in scope. To do so, this task can make use of existing System Constant Value Set s and/or Postbuid Variant Set s or define new ones. Several PredefinedVariant s can be combined to one Evaluated Variant Set . This task can also be applied when designing a subsystem, therefore the System Extract is an optional input.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	Mapping of Software Components to ECUs	1

3.3.1.11 Define System Timing

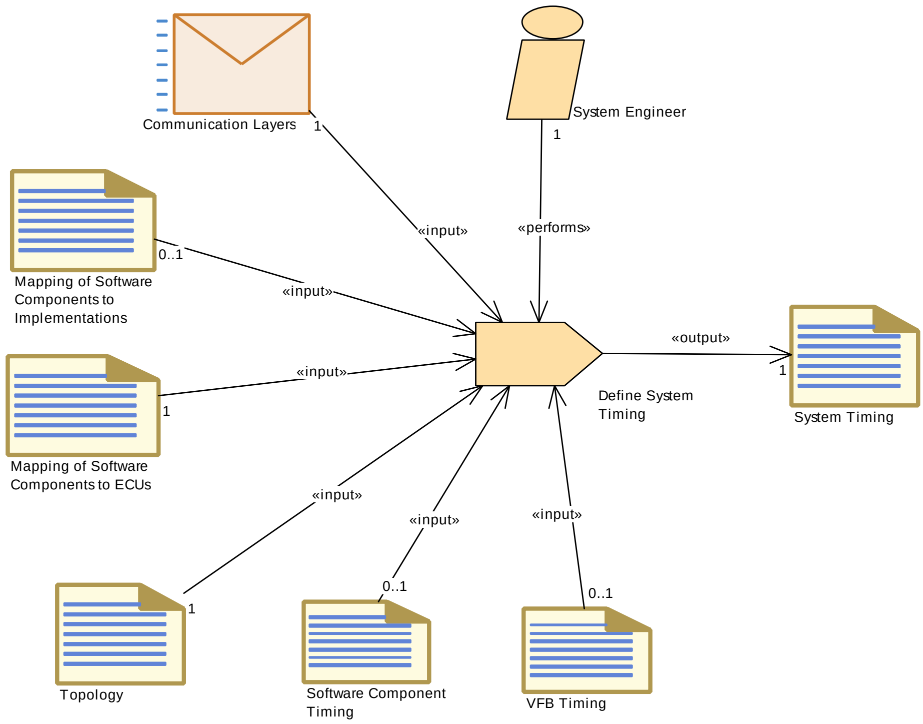

Figure 3.42: Define System Timing

Task Definition	**Define System Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Define SystemTiming for a concrete system taking the mapping of software components to ECUs and their implementation into account		
Description	Define SystemTiming (TimingDescription and TimingConstraints) for a concrete system taking the mapping of software components to ECUs and their implementation into account. This means that the resulting Communication Matrix (and its implication to the communication stack) can also be referenced by the timing specification to refine remote communication timing behavior.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Communication Layers	1	
Consumes	Mapping of Software Components to ECUs	1	
Consumes	Topology	1	
Consumes	Mapping of Software Components to Implementations	0..1	
Consumes	Software Component Timing	0..1	
Consumes	VFB Timing	0..1	

Relation Type	Related Element	Mul.	Note
Produces	System Timing	1	

Table 3.84: Define System Timing

3.3.1.12 Extend Topology

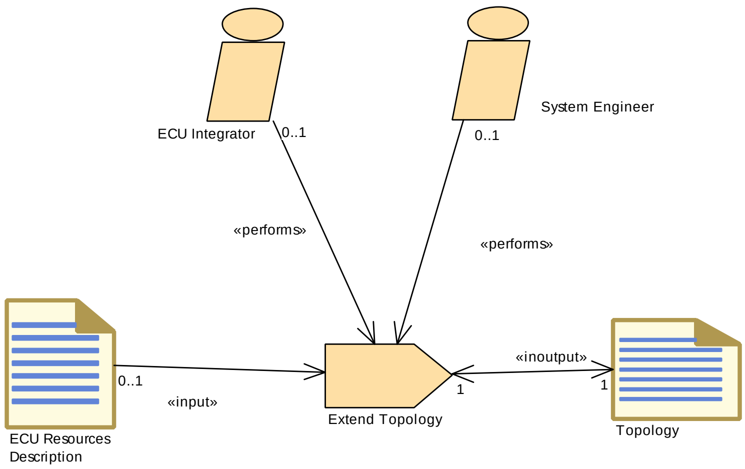

Figure 3.43: Extend Topology

Task Definition	Extend Topology		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Extend the existing System Topology		
Description	Extend the existing System Topology by describing how new ECUs will be connected to the existing one through the current network		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	0..1	
Performer	System Engineer	0..1	
Consumes	ECU Resources Description	0..1	
ParameterInOut	Topology	1

3.3.1.13 Select Software Component Implementation

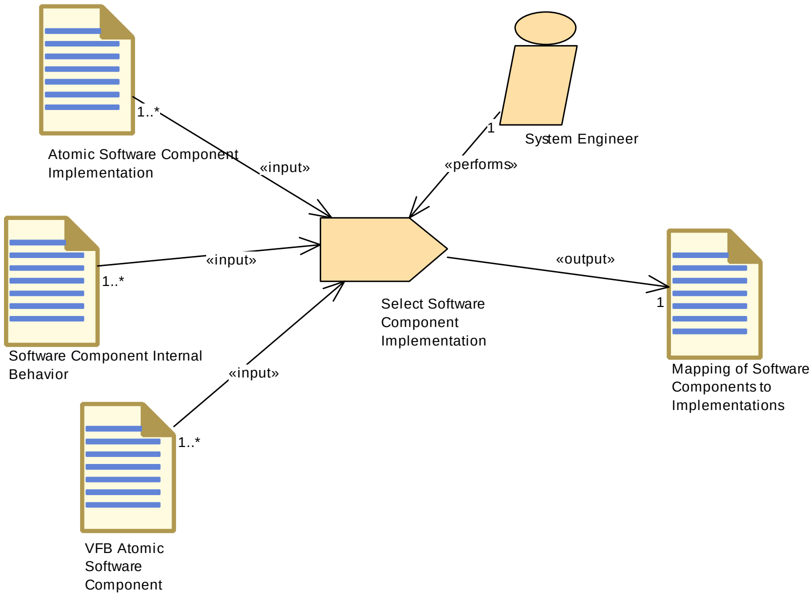

Figure 3.44: Select Software Component Implementation

Task Definition	**Select Software Component Implementation**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Select implementation for an atomic software component.		
Description	The system engineer selects an Atomic Software Component Implementation for each defined VFB Atomic Software Component		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Atomic Software Component Implementation	1..*	
Consumes	Software Component Internal Behavior	1..*	
Consumes	VFB Atomic Software Component	1..*	
Produces	Mapping of Software Components to Implementations	1	

Table 3.86: Select Software Component Implementation

3.3.1.14 Select Design Time Variant

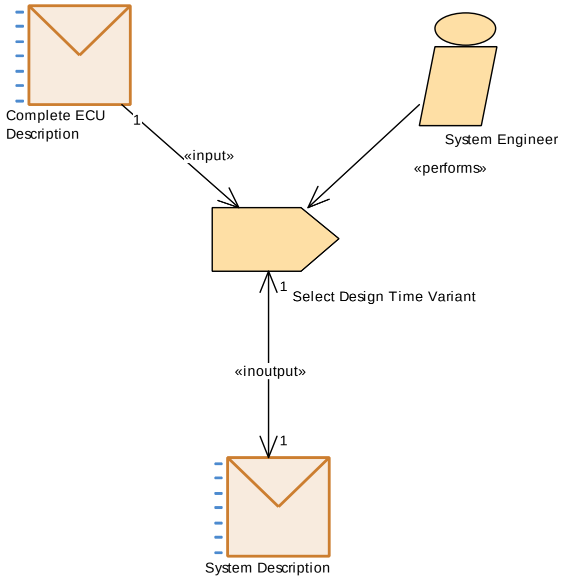

Figure 3.45: Select Design Time Variant

Task Definition	**Select Design Time Variant**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Tasks		
Brief Description	Select a system variant at system design time.		
Description	Select a system variant at system design time. This could be done in different ways: Replace a model, which contains the variation points contributing to this particular variant and all the possible settings/elements, by a model, which does no more contain these variation points and which contains only the particular settings/elements selected for this variant. In order to document the selection for further process steps, it is also possible to keep the information about the selected variant and the variation points in the model by introducing a PredefinedVariant along with appropriate fixed settings of system constant values. In constrast to variant selection in later process steps, no code generation or compilation is involved at system design time, thus this task is just a transformation of one XML model into another one. This task can be applied to a complete system description, represented by a System Extract		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1	
Consumes	Complete ECU Description	1	
ParameterInOut	System Description	1

3.3.2 Work Products

3.3.2.1 System Description

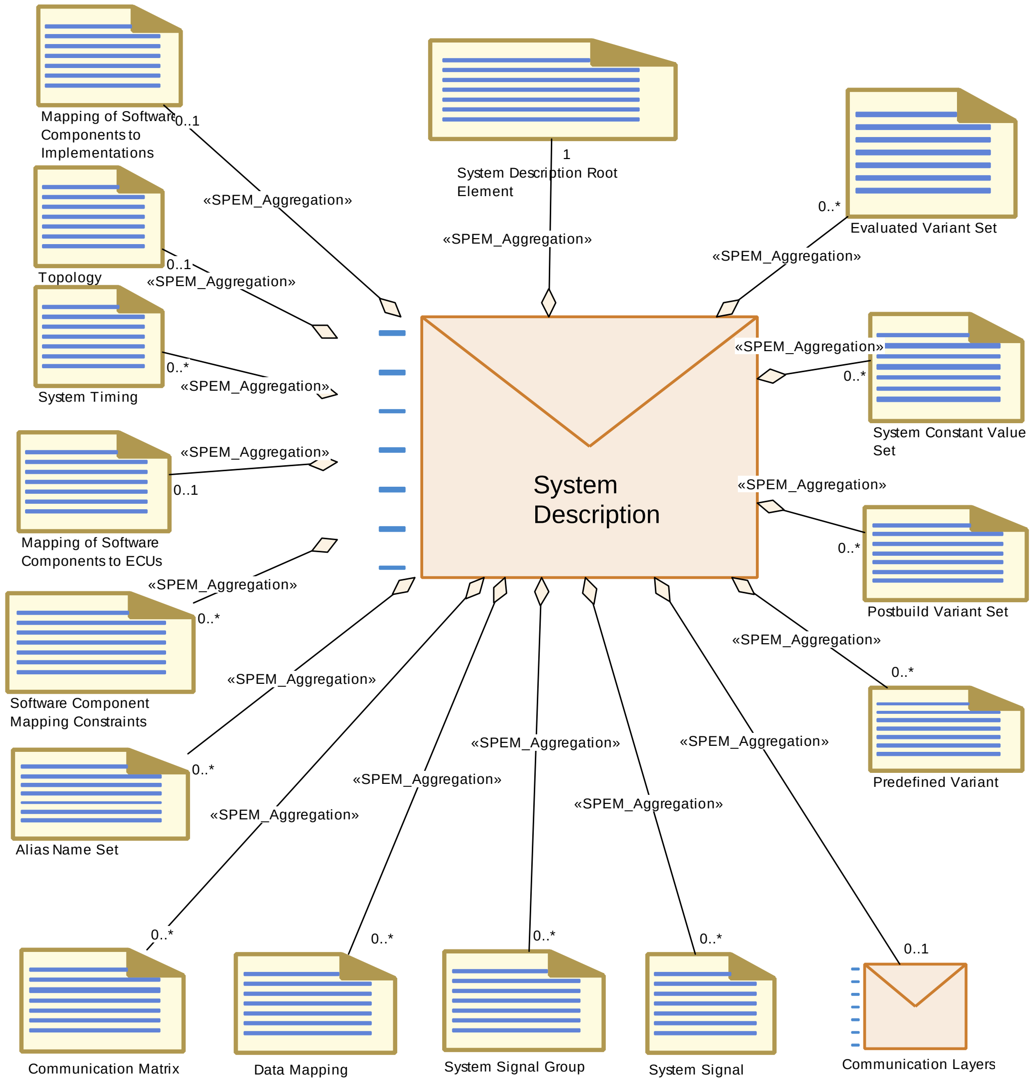

Figure 3.46: Structure of generic deliverable System Description

Deliverable	**System Description**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	Partial Extract of a System		
Description	Generic deliverable for defining a System. It is used in different roles within the methodology. In each role, this deliverable may contain variation points in its ARXML artifacts which need to be bound in later steps, e.g. when defining a subsystem from a complete system or later for the single ECUs. If such variation points are present, the System Description may optionally include PredefinedVariants in order to predefine variants for later selection and an Evaluated Variant Set.		
Kind	Delivered

3.3.2.3 System Description Root Element

Artifact	**System Description Root Element**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	A System Description root element.		
Description	The System description defines the following major elements: • Topology : description of the Topology of the System. • Software : description of the root software composition containing all software components in the System in a hierarchical structure. • Communication : description of all Communication elements used in the System. • Mapping and Mapping Constraints : description of all mapping aspects (mapping of SW components to ECUs, mapping of data elements to signals, and mapping constraints). The root element can be the basis for a System extract as well as for the whole System depending on which elements are aggregated.		
Kind	AUTOSAR XML		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	System Description	1	
ProducedBy	Assign Top Level Composition	1	
ProducedBy	Set System Root	1	Set up the root element, and the links to other artifacts
ConsumedBy	Define System Variants	1	
ConsumedBy	Flatten Software Composition	1	find the top level composition
ConsumedBy	Generate or Adjust System Flat Map	1	
atpUseMetaModelElement	System	1	

Table 3.93: System Description Root Element

3.3.2.4 System Mapping Overview

There are various artifacts which correspond to the mappings collected under the meta-model element `SystemMapping`. Figure 3.48 shows an overview. The details will be explained in the following sub-chapters.

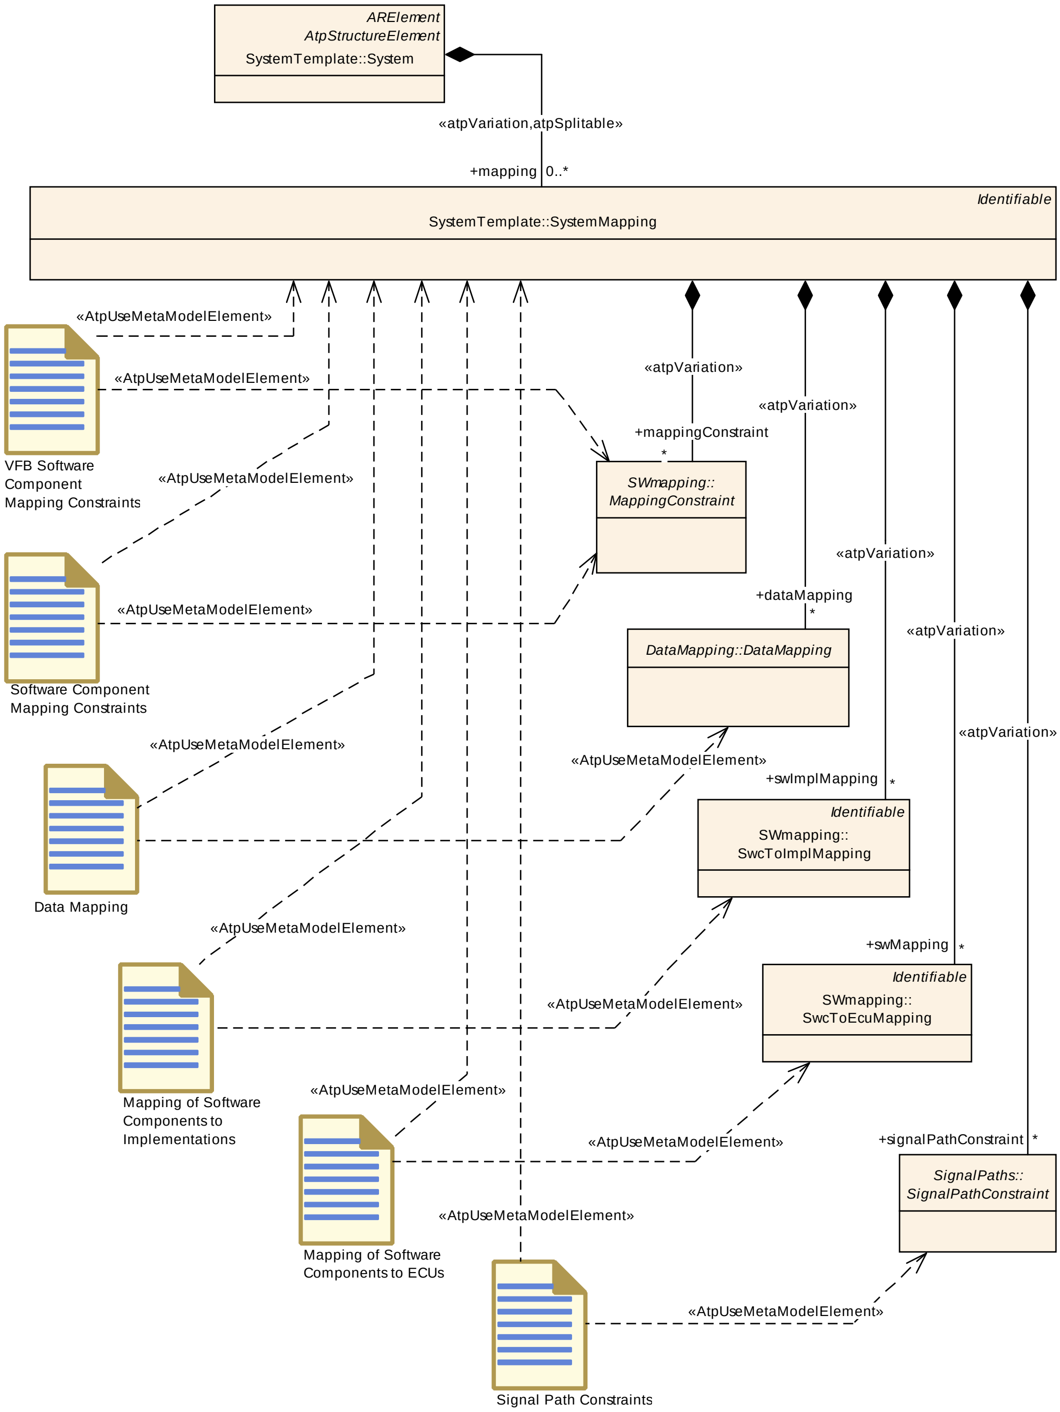

Figure 3.48: Overview on the various artifacts for System Mapping

3.3.2.5 Software Component Mapping Contraints

Artifact	**Software Component Mapping Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	Defined constraints on how certain components must be mapped (clustered or separated).		
Description	Description of one or more constraints on Software Components during mapping to the ECUs. Three type of constraints have been defined: The ComponentClustering constraint (also, clustering) is to be used for expressing that a certain set of SW components (atomic or not) must be mapped (allocated) onto the same ECU. This is some kind of "execute together on same ECU" constraint.The semantic of the clustering constraint is straightforward if all concerned SW components are atomic. Otherwise, it shall be interpreted as follows: all of the atomic SW components making up the composition must be mapped together onto the same ECU together with all other SW components (atomic or not) affected by the constraint. This also means that a clustering constraint can also refer to only a single composition. The ComponentSeparation constraint (also, separation) is to be used for expressing that two SW components (atomic or not) shall not be mapped (allocated) onto the same ECU. This is some kind of do not execute together on same ECU constraint.The semantic of the separation constraint is straightforward if one or both SW components are atomic. Otherwise, it shall be interpreted as follows: any of the atomic SW components making up the first composition, must not be mapped onto the same ECU with any atomic SW component from the second composition. As a consequence, and to preserve consistency, an atomic SW component instance cannot be part of two compositions concerned by the same separation constraint, i.e. the two compositions have to be disjoint with regards to component instances. SwcToEcuMapping constraint: The System Constraint Description has to describe dedicated and exclusive mapping of SW-Cs to one or more ECUs.		
Kind	AUTOSAR XML

Table 3.97: Mapping of Software Components to Implementations

3.3.2.9 Signal Path Constraints

Artifact	**Signal Path Constraints**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System:: Work products		
Brief Description	Constraints on the Path that should be used or not by Signals		
Description	One of the tasks of the System Generator is actually to calculate automatically the communication (signals) between the RTEs and define the needed frames for that communication. These definitions of the frames include implicitly the definition of the paths the AUTOSAR-Signals are transmitted through the system. Thereby the System Generator often has the choice between alternative ways through the system. There exist four different constraints for signals regarding the signal path: • The CommonSignalPath describes that two signals must take the same way (Signal Path) in the topology. • 'The ForbiddenSignalPath describes the way (Signal Path) that a signal must not take in the topology, e.g. in case of safety critical transmission. • The PermissibleSignalPath describes the way (Signal Path) a signal can take in the topology. If more than one PermissibleSignalPath is defined for the same signal/operation attributes, any of them can be chosen. • The SeparateSignalPath describes that two or more signals must not take the same way (Signal Path) in the topology e.g. in case of redundant transmission. It is also possible that the same signal is aggregated two times by the SeparateSignalPath element to indicate that this signal should be transmitted redundantly over two different paths.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Define Signal Path Constraints	1	
ConsumedBy	Set System Root	1	Only the reference to the artifact is needed
atpUseMetaModelElement	SignalPathCon-straint	1	
atpUseMetaModelElement	SystemMapping	1	The splitable element SystemMapping is the root for this artifact.

Table 3.98: Signal Path Constraints

3.3.2.10 Topology

Artifact	**Topology**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	The system topology, which may be reused in different systems.		
Description	Describes the topology of the system : A topology is formed by a number of EcuInstances that are interconnected to each other in order to form ensembles of ECUs and CommunicationClusters.		
Kind	AUTOSAR XML		
Relation Type	**Related Element**	**Mul.**	**Note**
AggregatedBy	System Description	0..1

Table 3.99: Topology

3.3.2.11 Ecu Resources Description

Artifact	**ECU Resources Description**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	Definition of the resources available on an ECU.		
Description	Definition of the resources available on an ECU. It mainly contains a description of hardware elements (like physical memory sections or peripherals, pins, hardware connections) which need to be referred by a software component or a basic software description. The focus is to describe an already engineered piece of hardware, its content and structure. It is not in the focus of the ECU Resource Description to support the design of electronics hardware itself. In the XML it is represented as a set of HwDescriptionEntity -s

Table 3.100: ECU Resources Description

3.3.2.12 System Signal

Artifact	**System Signal**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description			
Description	The system signals allow to represent this communication view in a flattened structure, with (at least) one system signal defined for each data element sent or received by a SW component instance. If data has to be sent over gateways, there is still only one system signal representing this data. The representation of the data on the individual communication systems is done by the cluster signals.		
Kind	AUTOSAR XML

3.3.2.13 System Signal Group

Artifact	**System Signal Group**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	A signal group refers to a set of signals that must always be kept together. A signal group is used to guarantee the atomic transfer of AUTOSAR composite data types.		
Description	The System Signal Group is representing a set of Signals that must be kept together. A signal group is to guarantee the transfer of AUTOSAR composite data types for sender receiver communication.The RTE is required to treat AUTOSAR signals transmitted using sender-receiver communication atomically. To achieve this, the "signal group" mechanisms shall be utilized.It is not possible to map a Variable Data Prototype with a composite datatype directly to a System Signal . The complex data type must be decomposed into single signals. As this set of single signals has to be treated as atomic, it is placed in a "signal group". It is also used in client server communication when the RTE maps a response to a corresponding operation request. The arguments, application errors, client identifier and sequence counter of an operation are mapped to System Signal of two dedicated SystemSignalGroup elements;one for the request and one for the response. The RTE Client Server Protocol is used to provide a specific semantics to each of these SystemSignalGroups and System Signal , also those which are introduced only to support the protocol.

3.3.2.14 System Flat Map

Artifact	**System Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Work products		
Brief Description	Mapping of instance names to nested model elements. Use cases: Resolve name conflicts when flattening VFB software compositions; provide unique names and unique model references for measurement and calibration data.		
Description	The flat map is a list of elements, each element represents exactly one node (e.g. a component instance or data element) of the instance tree of a software system. The purpose of this element is to map the various nested representations of this instance to a flat representation and assign a unique name to it. The name will be unique in the scope to which this Flat Map belongs (which could be a whole System or a System Extract). Use case: The System Flat Map is defined in the context of a System or System Extract. It serves as a basis for generating an ECU Flat Map (or a Flat Map of a "child" System Extract). In the ECU Flat Map, the names will be used as display names for MCD tools or as names for component prototypes in a flattened software composition. For further information refer to the description of artifact ECU Flat Map.

3.3.3 Communication Matrix and Communication Layers

This section contains the tasks and work products to set up the communication matrix and the communication layers as part of a system description.

3.3.3.1 Tasks

3.3.3.2 Define Communication Matrix

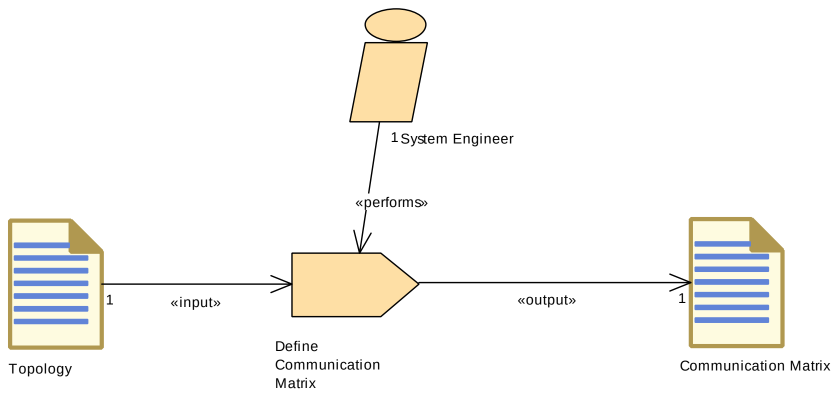

Figure 3.49: Define Communication Matrix

Task Definition	Define Communication Matrix		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Communication Matrix::Tasks		
Brief Description	The communication matrix contents are created or extended by adding communication definitions.		
Description	Define or extend Communication Matrix. Define the triggering of the Physical Channels and the mapping to the communication connector ports. In case of extension the original communication matrix contents (which were delivered as part of a system extract) are extended by adding communication definitions. The main use case is the extension of the communication matrix when refining a sub-system.

3.3.3.2.3 Define TP

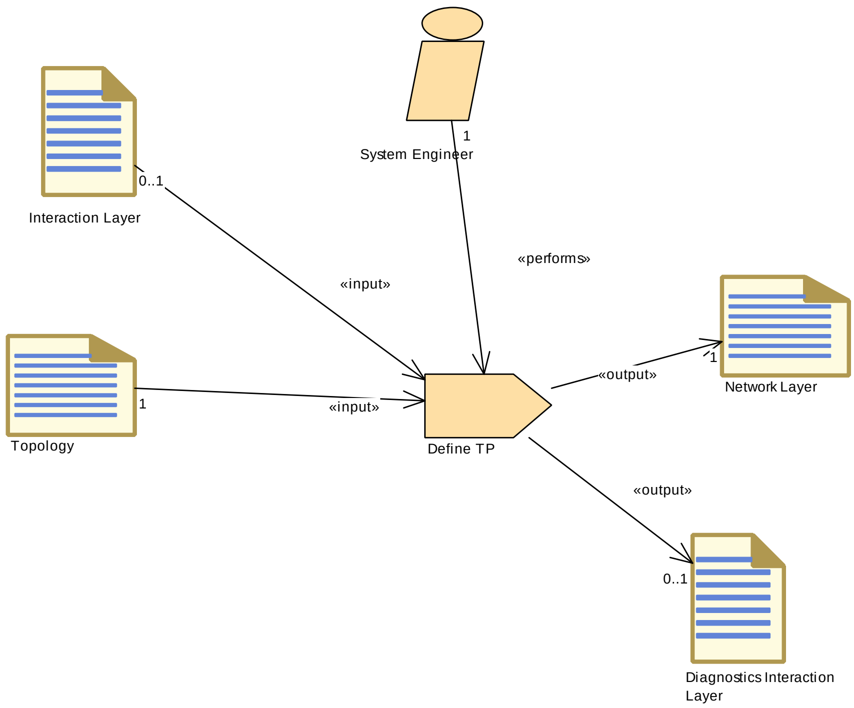

Figure 3.52: Define TP

Task Definition	**Define TP**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Communication Matrix::Tasks		
Brief Description	Define the Network management and the N-PDUs		
Description	Define the N-PDU - Network Layer Protocol Data Unit (assembled and disassembled in a Transport Protocol module). If an I-PDU does not fit into one frame, a segmentation is needed and will be done through several N-PDUs by the Transport Protocol module. If large COM PDUs are transported by TP, the Interaction Layer should be the Input to the Define TP task. If Diagnostic is used then the Diagnostics Interaction Layer should be an output of Task Define TP.

3.3.3.2.5 Define PDU Gateway

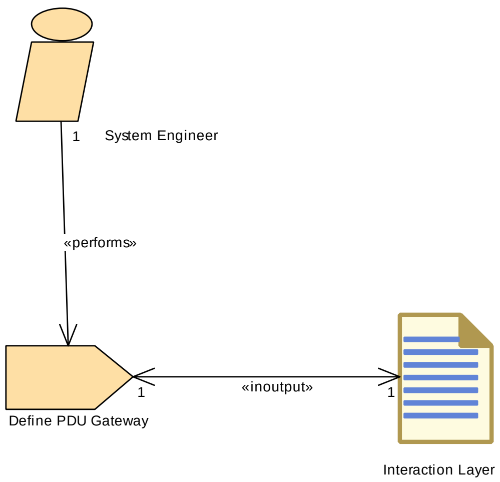

Figure 3.54: Define PDU Gateway

Task Definition	**Define PDU Gateway**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Communication Matrix::Tasks		
Brief Description	Define the gateway for IPDUs		
Description	Define the gateways that are transferring the I-Pdus from one channel to the other in pairs. Each pair consist of a source and a target referencing to a IPduTriggering. In the case that a Pdu is being gatewayed to more than one channel of the same cluster, all of this gateway relationships shall be specified. Therefore, all affected IpduTriggerings must be described as gateway mappings.

3.3.3.3.3 Data Link Layer

Artifact	**Data Link Layer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Communication Matrix::Work products		
Brief Description	Describes the frames that are used in the Data Link Layer		
Description	Describes the layout of frames to be sent over communication channels. This definition belongs to the Data Link Layer. The Data Link Layer provides the functional and procedural means to transfer data between network entities. This layer is used to transmit data passed by an upper layer (PduR, Tp) between adjacent network nodes. In AUTOSAR the Drivers (FrDrv, CanDrv, LinDrv) and Interfaces (FrIf, CanIf, LinIf) belong to the Data Link Layer.

3.3.3.3.4 Interaction Layer

Artifact	**Interaction Layer**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::Communication Matrix::Work products		
Brief Description	Describes the Signals of the Interaction Layer.		
Description	Describes the Signals of the Interaction Layer. These means describing the Interface between the pre-compile configured RTE and the potentially post-build configured Com Stack. The Interaction Layer provides the application programming interface for COM. It consists of services for the transfer (send and receive operations) of signals. The Interaction Layer packs one or more signals into assigned I-Pdus and passes them to the underlying layer for transfer between nodes in a network. This artifact includes also the mapping definition of ISignals to System Signals.		
Kind	AUTOSAR XML

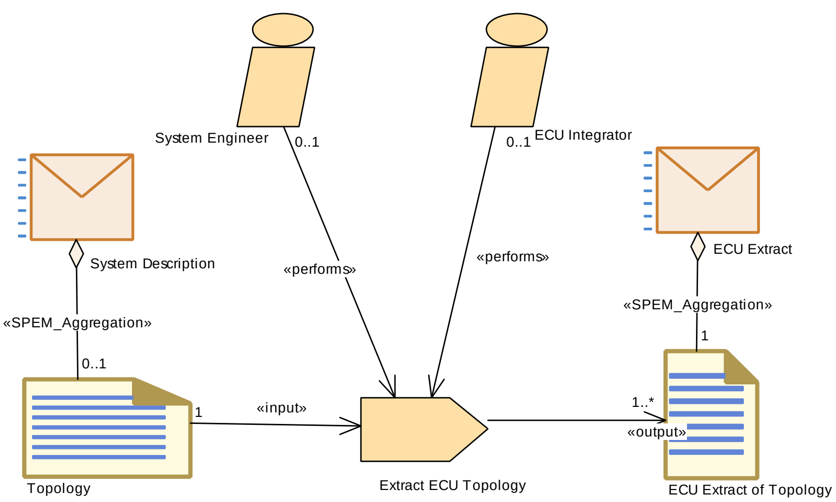

Figure 3.59: Extract ECU Topology

Task Definition	**Extract ECU Topology**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::ECU Extract::Tasks		
Brief Description	Extract the topology for a single ECU from the System Topology		
Description	From the System or System Extract Topology, extract the topology for a single ECU.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	0..1	
Performer	System Engineer	0..1	
Consumes	Topology	1	
Produces	ECU Extract of Topology	1..*	

Table 3.119: Extract ECU Topology

3.3.4.1.2 Generate or Adjust ECU Flat Map

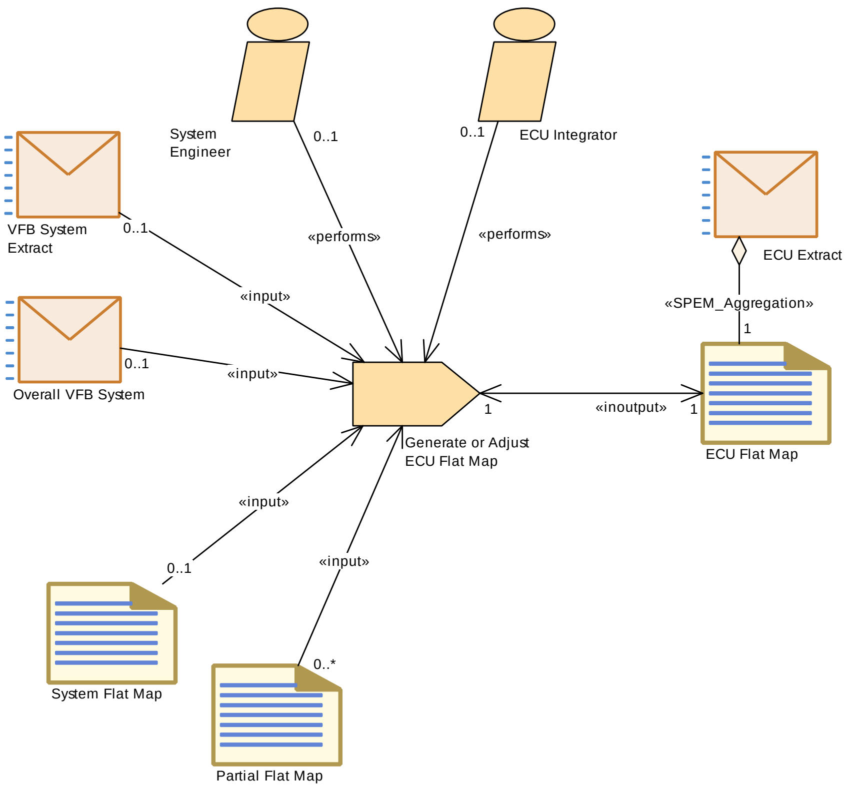

Figure 3.60: Generate or Adjust ECU Flat Map

Task Definition	**Generate or Adjust ECU Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::ECU Extract::Tasks		
Brief Description	Generates and/or adjust the unique names of component prototypes and MCD display data in the scope of a single ECU.		
Description	Generates and/or adjust the unique names of component prototypes and MCD display data in the scope of a single ECU. This information is kept in the so-called ECU Flat Map. The names can be generated according to some rules (e.g. from model elements of the VFB system), taken over from the System Flat Map, from partial Flat Maps, or be manually defined. The task shall always result in an ECU Flat Map with unique names.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	0..1	
Performer	System Engineer	0..1	
Consumes	Overall VFB System	0..1	Used to set the upstream references in case one starts from a complete system.
Consumes	System Flat Map	0..1	Take over definitions of unique names from system level to ECU level.
Consumes	VFB System Extract	0..1	Used to set the upstream references in case one starts from a system extract.
Consumes	Partial Flat Map	0..*	If Partial Flat Maps were delivered along with software components referring only to ECU internal information, they may be integrated into the ECU Flat Map directly, i.e. without needing the System Flat Map. • The instance refs used in a partial flat map must be taken over and adjusted to the context ECU Extract. • Name conflicts have to be resolved if several partial flat maps are merged.
ParameterInOut	ECU Flat Map	1	

Table 3.120: Generate or Adjust ECU Flat Map

3.3.4.1.3 Flatten Software Composition

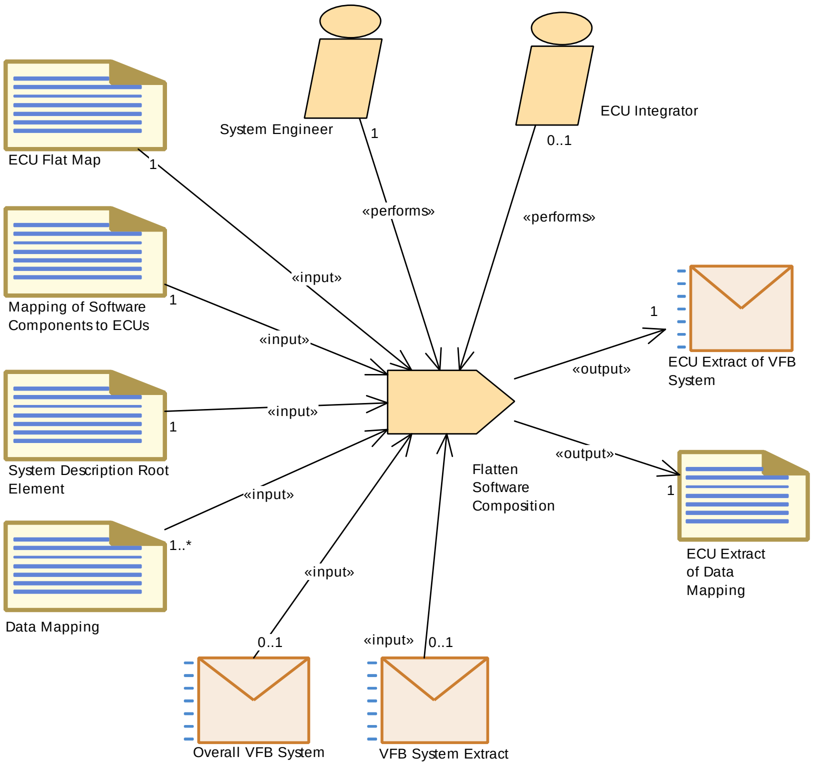

Figure 3.61: Flatten Software Composition

Task Definition	**Flatten Software Composition**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::ECU Extract::Tasks		
Brief Description	Extract and flatten the ECU Software Composition.		
Description	Generate the complete software composition in an ECU by copying ComponentPrototypes from the VFB description into a flat representation (still without service components). Flat representation means, that all compositions are removed and a "flat" set of ComponetPrototypes is generated. Due to the replication of ComponentPrototypes new names have to be generated for those. These can be predefined in the FlatMap which is an input to this task. The ECU Extract of Data Mapping is also created by this task, as the references to the Data Prototypes need to be created with respect to the new component structure.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	System Engineer	1

3.3.4.2.8 ECU Extract of System Variant Model

Deliverable	**ECU Extract of System Variant Model**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::ECU Extract::Work products		
Brief Description			
Description	An extract of the System artifacts • System Constant Value Set • Postbuld Variant Set • Predefined Variant • Evaluated Variant Set It contains only the elements relevant for a particular ECU.		
Kind			
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	ECU Extract	0..1	
Aggregates	Evaluated Variant Set	0..*	
Aggregates	Postbuild Variant Set	0..*	
Aggregates	Predefined Variant	0..*	
Aggregates	System Constant Value Set	0..*	
ProducedBy	Extract ECU System Variant Model	1	

Table 3.132: ECU Extract of System Variant Model

3.3.4.2.9 ECU Flat Map

Artifact	**ECU Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::System::ECU Extract::Work products		
Brief Description	Mapping of instance names to nested model elements. Use cases: Resolve name conflicts when flattening VFB software compositions; provide unique names for measurement and calibration data.		
Description	The flat map is a list of elements, each element represents exactly one node (e.g. a component instance or data element) of the instance tree of a software system. The purpose of this element is to map the various nested representations of this instance to a flat representation and assign a unique name to it. The name will be unique in the scope of a single ECU. (Note that additional alias names can be defined via artifact Alias Name Set.) Use cases: • Specify the display name of a data object for measurement and calibration. This serves as an input for the calibration support which is produced by the RTE generator. The RTE generator needs to find the attributes assigned to these data via the attached references. • Specify a unique name for an instance of a component prototype in the ECU extract of the system description. This information is needed to set up the ECU extract. • Assign initial values to calibration parameters as input for the RTE generator.		
Kind	AUTOSAR XML		
Relation Type	**Related Element**	**Mul.**	**Note**
AggregatedBy	ECU Extract	1	
ParameterInOut	Generate or Adjust ECU Flat Map	1	
ConsumedBy	Flatten Software Composition	1	
ConsumedBy	Generate Local MC Data Support	1	
ConsumedBy	Provide RTE Calibration Dataset	1

3.4 Software Component

This chapter contains the definition of work products and tasks used for the development of a single software component against a given VFB description. For the definition of the relevant meta-model elements refer to [4].

3.4.1 Tasks

3.4.1.1 Define Software Component Internal Behavior

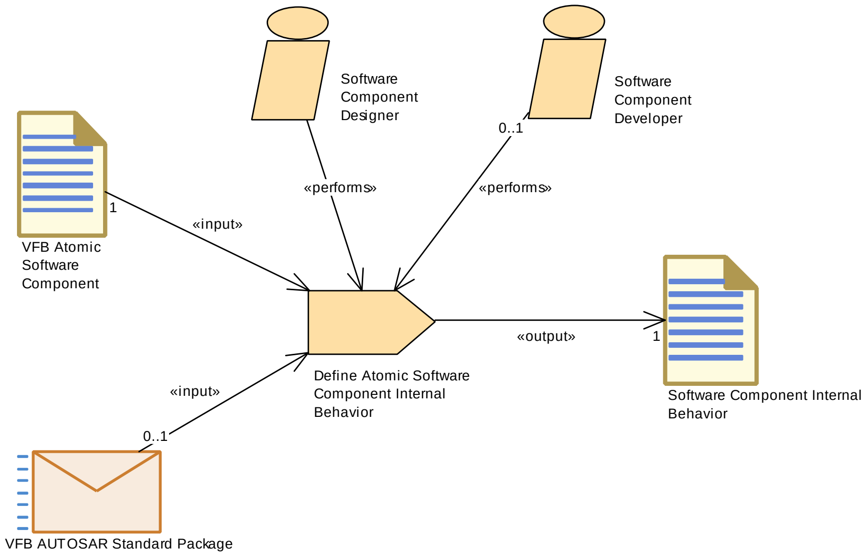

Figure 3.66: Define Software Component Internal Behavior

Task Definition	**Define Atomic Software Component Internal Behavior**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Define the InternalBehavior in relation to a given AtomicSoftwareComponentType		
Description	Define the InternalBehavior in relation to a given AtomicSoftwareComponentType so that an RTE API can be generated. This includes the definition of Runnables, RTE Events, Inter-Runnable variables, etc.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Performer	Software Component Developer	0..1	
Consumes	VFB Atomic Software Component	1	
Consumes	VFB AUTOSAR Standard Package	0..1	Use standardized elements (e.g. Data Types) as blueprints (as far as applicable) to create the corresponding elements of the actual project.
Produces	Software Component Internal Behavior	1	

Table 3.134: Define Atomic Software Component Internal Behavior

3.4.1.2 Define Partial Flat Map

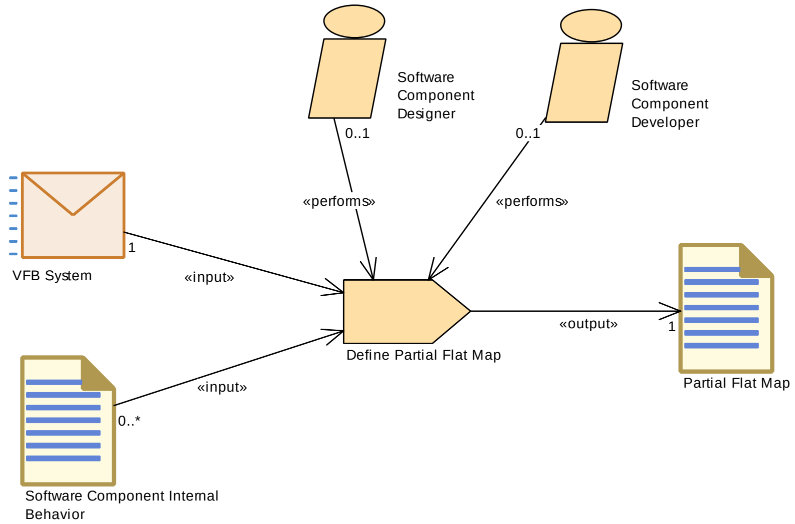

Figure 3.67: Define Partial Flat Map

Task Definition	**Define Partial Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description			
Description	Define a Partial Flat Map for an intended delivery of atomic software components.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	0..1	
Performer	Software Component Developer	0..1	
Consumes	VFB System	1	Various parts of a given VFB system will be used as input: • Refer to parameters and variables in port interfaces and their data types. • In order to define unique names, also other the component definitions not in the scope of the partial flat map might be checked. • Set a link to the context of the Flat Map, e.g. a VFB Composition.
Consumes	Software Component Internal Behavior	0..*	Refer to parameter and variables defined in the Internal Behavior of one or more atomic software components.
Produces	Partial Flat Map	1	

Table 3.135: Define Partial Flat Map

3.4.1.3 Define Software Component Timing

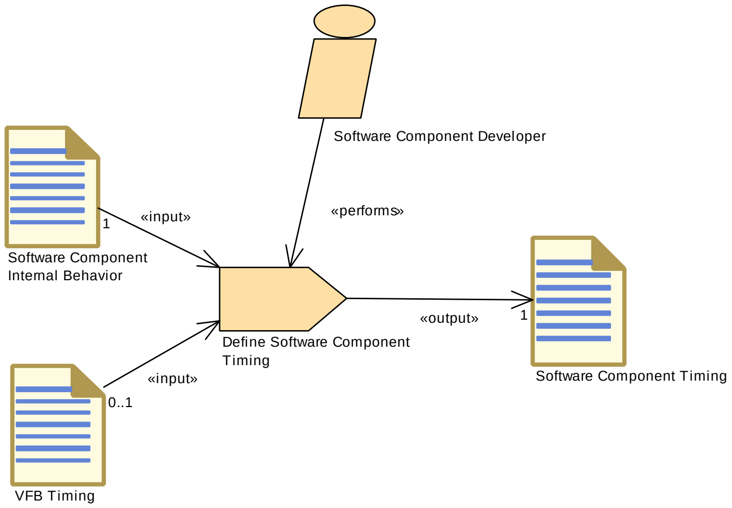

Figure 3.68: Define Software Component Timing

Task Definition	**Define Software Component Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Define SWCTiming (TimingDescription and TimingConstraints) for the Internal Behavior (RunnableEntities) of a Software Component		
Description	Define SWCTiming (TimingDescription and TimingConstraints) of a software component. A software component can either be of type AtomicSWComponentType or CompositionSWComponentType. In the former case, the task allows to describe timing description and constraints for the InternalBehavior of the AtomicSWComponentType. In the latter case, timing descriptions and constraints can be defined for all atomic software components in the CompositionSWComponentType.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Developer	1	
Consumes	Software Component Internal Behavior	1	
Consumes	VFB Timing	0..1	
Produces	Software Component Timing	1	

Table 3.136: Define Software Component Timing

3.4.1.4 Add Documentation to the Software Component

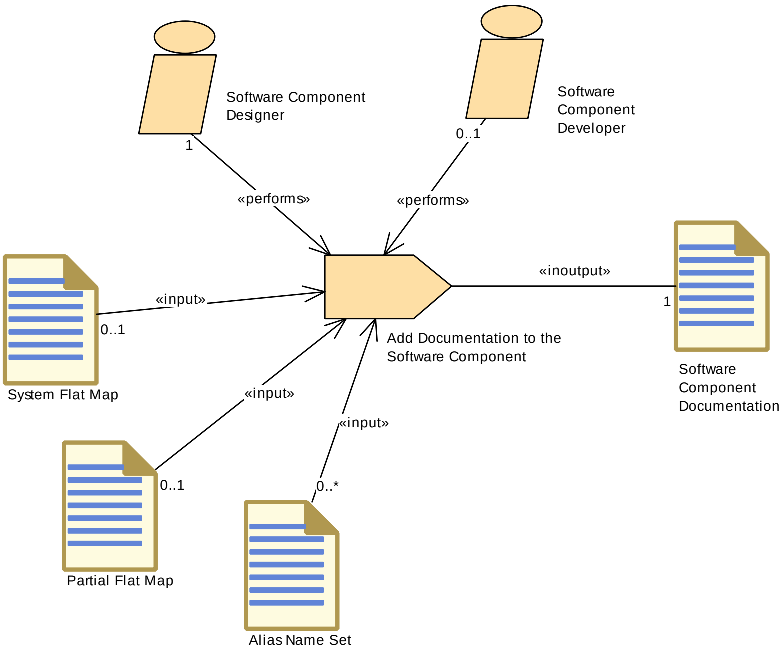

Figure 3.69: Add Documentation to the Software Component

Task Definition	**Add Documentation to the Software Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Add documentation to the Software Component		
Description	Add documentation to the Software Component describing the functionality, how to test it, the calibration uses, the maintenance and diagnosis issues.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Designer	1	
Performer	Software Component Developer	0..1	
Consumes	Partial Flat Map	0..1	Optional input in order to refer to unique names defined in component or composition context.
Consumes	System Flat Map	0..1	Optional input in order to refer to unique names defined in system context.
Consumes	Alias Name Set	0..*	Optional input in order to refer to unique names defined in an Alias Name Set (e.g. System Constants).
ParameterInOut	Software Component Documentation	1	

Table 3.137: Add Documentation to the Software Component

3.4.1.5 Generate Atomic Software Component Contract Header Files

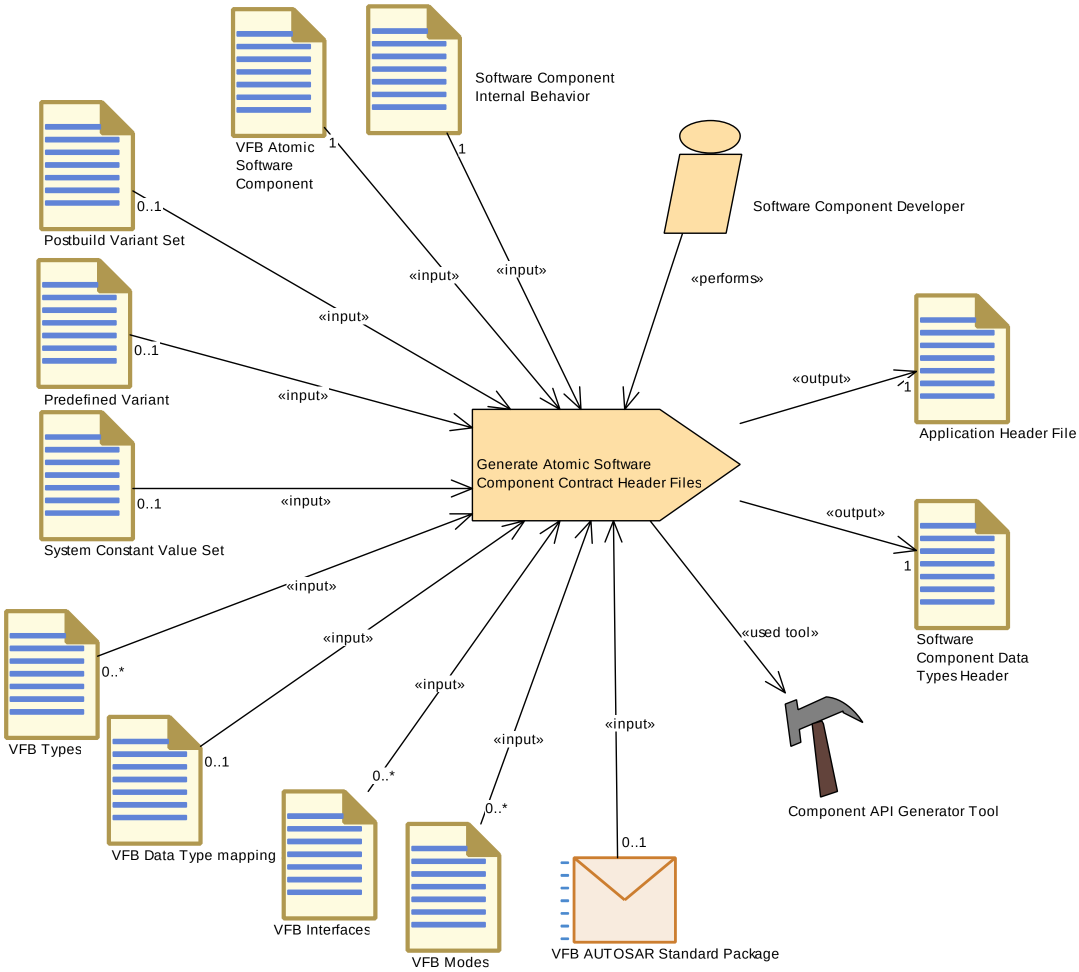

Figure 3.70: Generate Atomic Software Component Contract Header Files

Task Definition	**Generate Atomic Software Component Contract Header Files**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Generate the component contract header files.		
Description	Generate the component header files as part of the so-called "contract phase". These headers will allow to link the component lateron with the RTE. The header can still contain variants with later binding time, therefore the information about these variants is contained in the input to this task.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Developer	1	
Consumes	Software Component Internal Behavior	1	

Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	VFB Atomic Software Component	1	
Consumes	Postbuild Variant Set	0..1	
Consumes	Predefined Variant	0..1	
Consumes	System Constant Value Set	0..1	
Consumes	VFB AUTOSAR Standard Package	0..1	
Consumes	VFB Data Type mapping Set	0..1	
Consumes	VFB Interfaces	0..*	
Consumes	VFB Modes	0..*	
Consumes	VFB Types	0..*	
Produces	Application Header File	1	
Produces	Software Component Data Types Header	1	
UsedTool	Component API Generator Tool	1	

Table 3.138: Generate Atomic Software Component Contract Header Files

3.4.1.6 Generate Component Header File in Vendor Mode

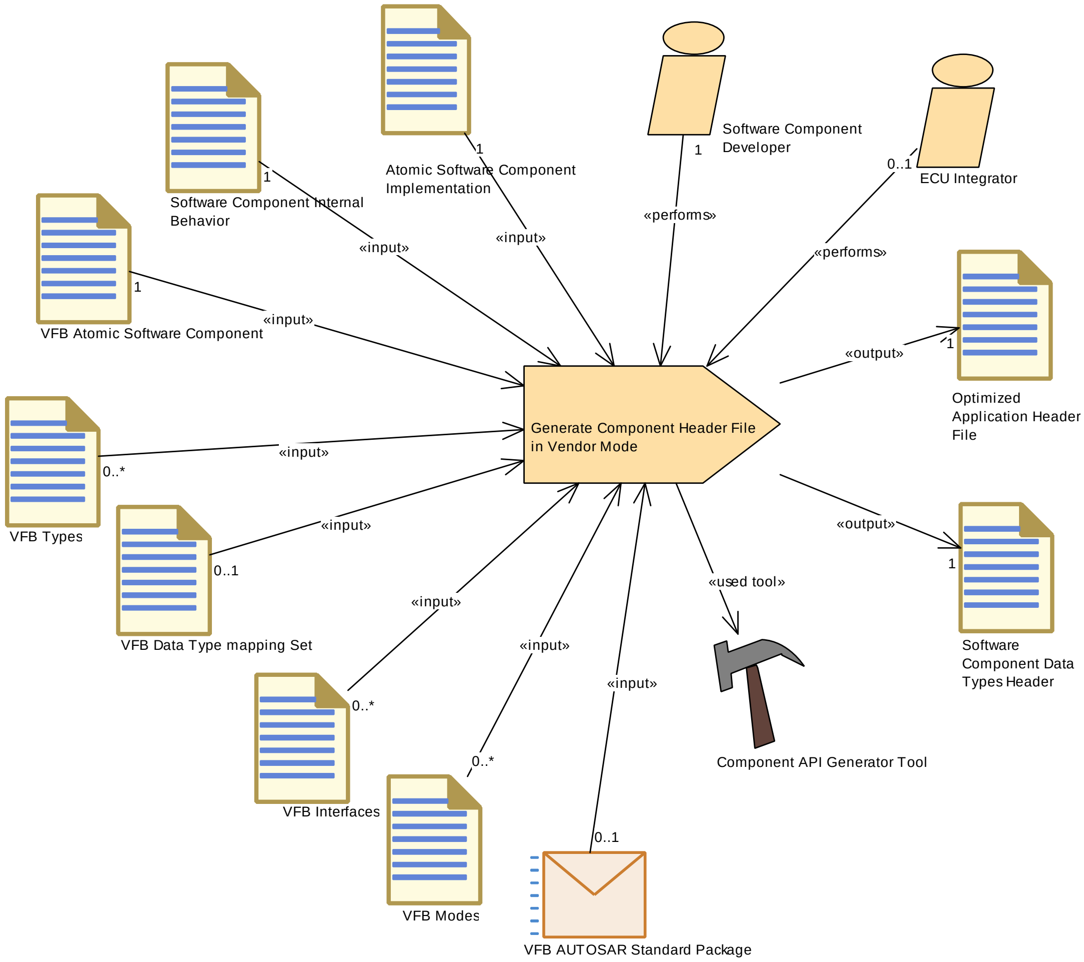

Figure 3.71: Generate Component Header File in Vendor Mode

Task Definition	**Generate Component Header File in Vendor Mode**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Generate an optimized component header file. This is achieved by using the RTE's vendor mode.		
Description	Generate an optimized component header file. This is achieved by using the RTE's vendor mode.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Developer	1	
Performer	ECU Integrator	0..1	
Consumes	Atomic Software Component Implementation	1	
Consumes	Software Component Internal Behavior	1

3.4.1.8 Implement Atomic Software Component

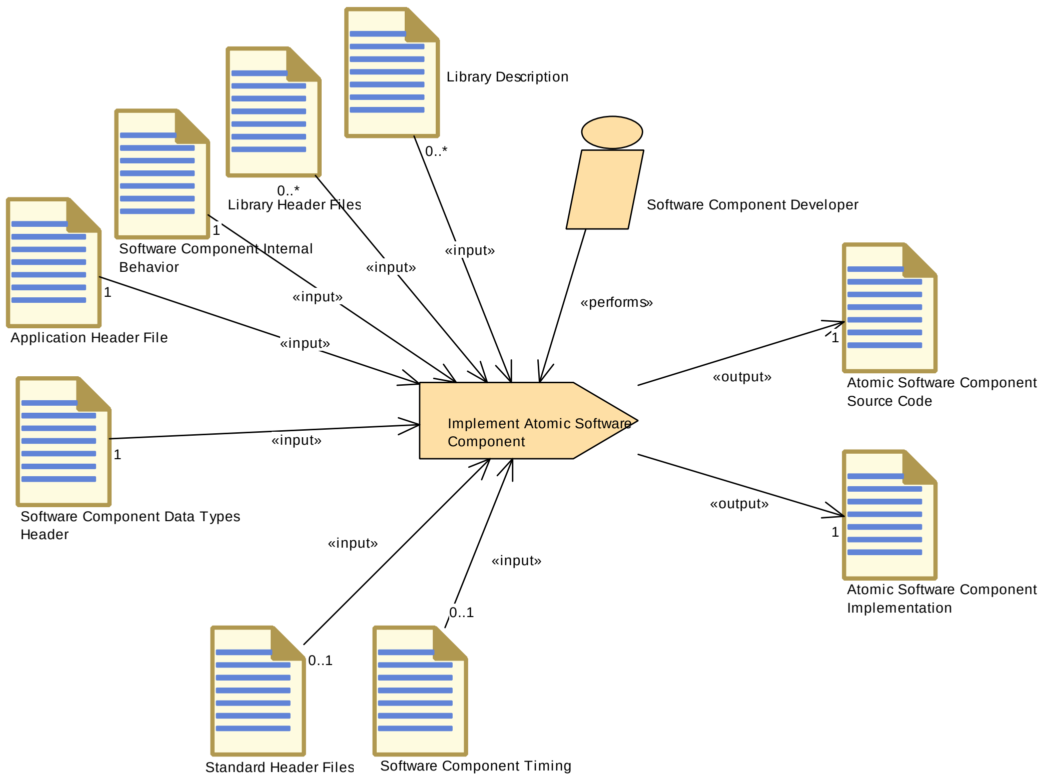

Figure 3.73: Implement Atomic Software Component

Task Definition	**Implement Atomic Software Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Implement the code of the AtomicSoftwareComponent and decribe the Implementation.		
Description	Implement the code of the AtomicSoftwareComponent against the generated component contract header. Document the basic information in the Implementation Description.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Developer	1	
Consumes	Application Header File	1	
Consumes	Software Component Data Types Header	1	
Consumes	Software Component Internal Behavior	1	
Consumes	Software Component Timing	0..1	
Consumes	Standard Header Files	0..1	
Consumes	Library Description	0..*	
Consumes	Library Header Files	0..*	
Produces	Atomic Software Component Implementation	1	
Produces	Atomic Software Component Source Code	1	

Table 3.141: Implement Atomic Software Component

3.4.1.9 Generate E2E Protection Wrapper

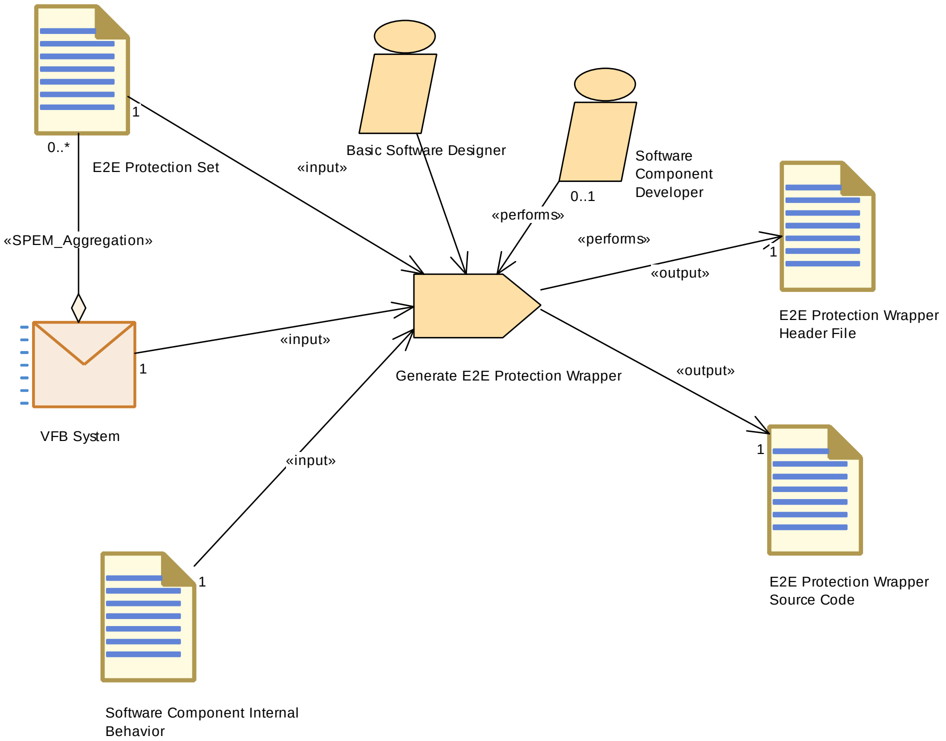

Figure 3.74: Generate E2E Protection Wrapper

Task Definition	**Generate E2E Protection Wrapper**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Generate E2E Protection Wrapper code		
Description	Generate E2E Protection Wrapper code. The header and source code are generated based on the E2E profile chosen for particular data elements and ports.		
Relation Type	***Related Element***	***Mul.***	***Note***
	Develop an Atomic Software Component	1	
Performer	Basic Software Designer	1	
Performer	Software Component Developer	0..1	
Consumes	E2E Protection Set	1	
Consumes	Software Component Internal Behavior	1	
Consumes	VFB System	1	Use all elements (like VFB types) that are referred by E2E Protection Set
Produces	E2E Protection Wrapper Header File	1	

Relation Type	Related Element	Mul.	Note
Produces	E2E Protection Wrapper Source Code	1	

Table 3.142: Generate E2E Protection Wrapper

3.4.1.10 Compile Atomic Software Component

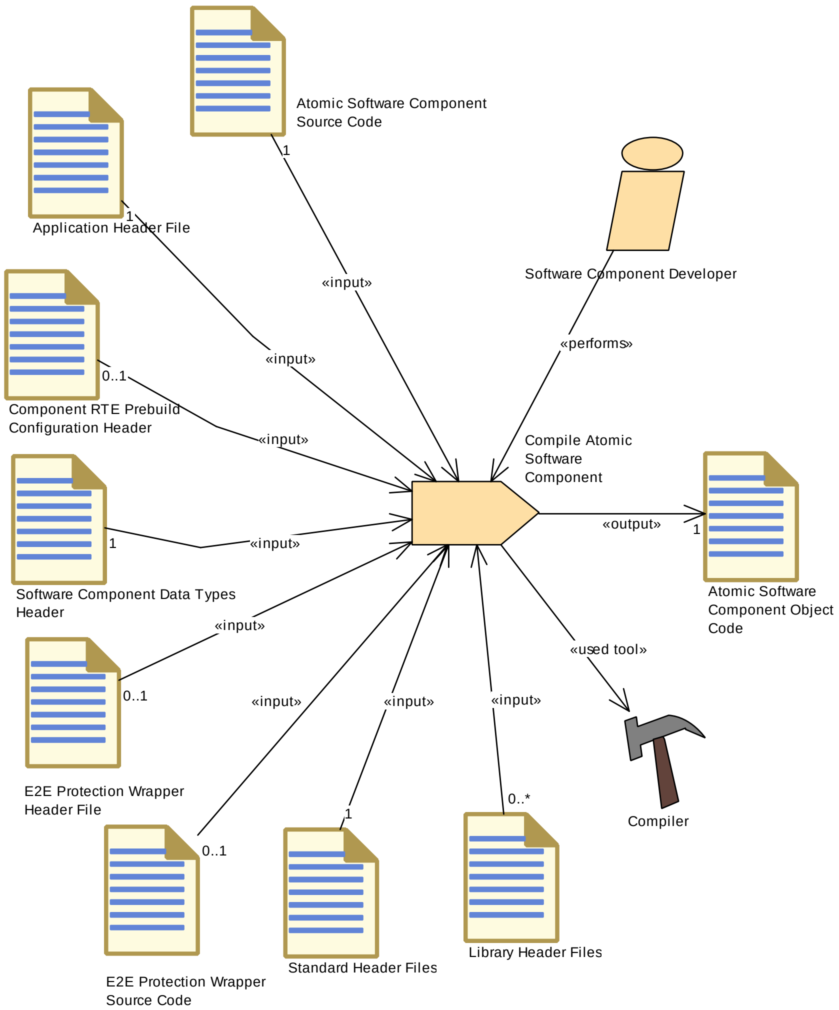

Figure 3.75: Compile Atomic Software Component

Task Definition	Compile Atomic Software Component		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Compile the AtomicSoftwareComponent independently of an ECU.		
Description	Compile the Atomic Software Component independently of an ECU.		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Software Component Developer	1	

Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	Application Header File	1	
Consumes	Atomic Software Component Source Code	1	
Consumes	Software Component Data Types Header	1	
Consumes	Standard Header Files	1	
Consumes	Component RTE Prebuild Configuration Header	0..1	
Consumes	E2E Protection Wrapper Header File	0..1	
Consumes	E2E Protection Wrapper Source Code	0..1	
Consumes	Library Header Files	0..*	
Produces	Atomic Software Component Object Code	1	The object file should include both code of the SWC and the E2E Protection Wrapper code (if present as an input).
UsedTool	Compiler	1	

Table 3.143: Compile Atomic Software Component

3.4.1.11 Map Software Component to BSW

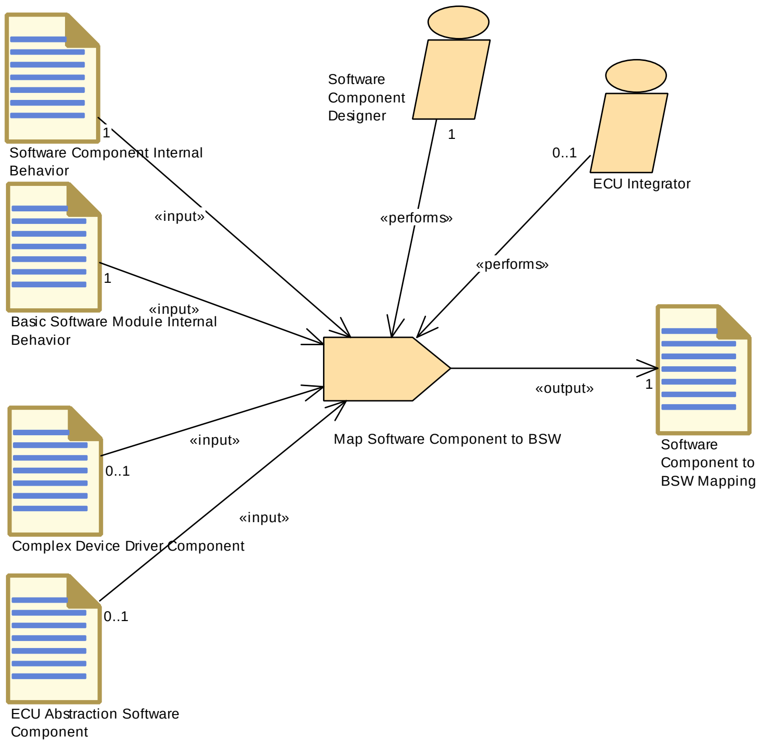

Figure 3.76: Map Software Component to BSW

Task Definition	**Map Software Component to BSW**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Define the mapping between a Software Component and a BSW Module.		
Description	Define the mapping between a Software Component and a BSW Module. Required only for Complex Drivers and ECU Abstraction Components. Note that for Service Components, this mapping will be generated in the ECU integration phase, so the latter is not considered as a task in the responsibility of the BSW developer.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Software Component Designer	1	
Performer	ECU Integrator	0..1	
Consumes	Basic Software Module Internal Behavior	1	
Consumes	Software Component Internal Behavior	1	
Consumes	Complex Device Driver Component	0..1	
Consumes	ECU Abstraction Software Component	0..1	

Relation Type	Related Element	Mul.	Note
Produces	Software Component to BSW Mapping	1	

Table 3.144: Map Software Component to BSW

3.4.1.12 Measure Component Resources

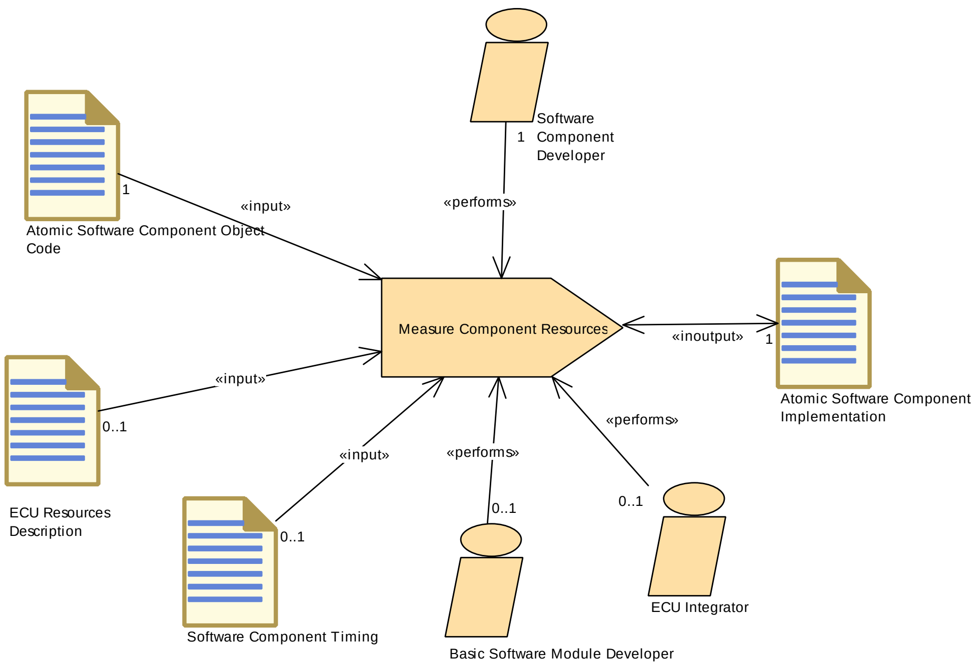

Figure 3.77: Measure Component Resources

Task Definition	Measure Component Resources		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Tasks		
Brief Description	Measure the resource consumption of an Atomic Software Component		
Description	Determine the resource consumption (memory, execution time) for a specific implementation of an Atomic Software Component in a certain context (ECU or test environment) and document the results in the Implementation description targeted at this specific platform. The ECU Resources Description is an optional input, because some results should be documented in relation to the hardware elements.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Software Component Developer	1	
Performer	Basic Software Module Developer	0..1	
Performer	ECU Integrator	0..1	

Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	Atomic Software Component Object Code	1	
Consumes	ECU Resources Description	0..1	
Consumes	Software Component Timing	0..1	
ParameterInOut	Atomic Software Component Implementation	1

3.4.2 Work Products

3.4.2.1 Delivered Atomic Software Components

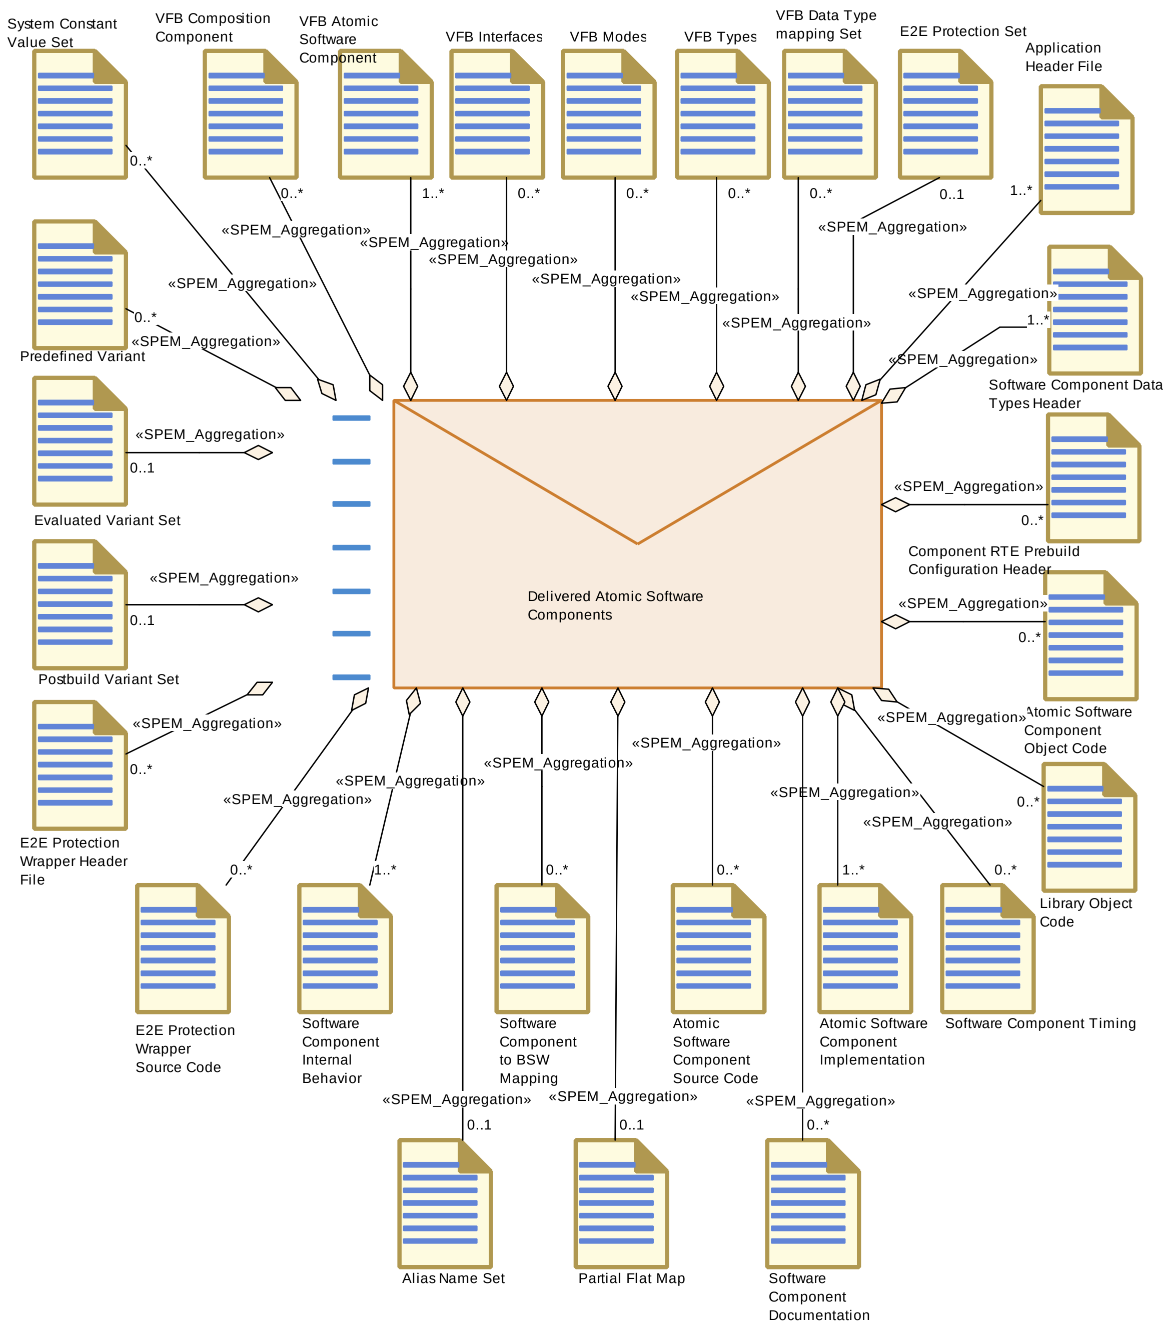

Figure 3.79: Delivered Atomic Software Components

Deliverable	**Delivered Atomic Software Components**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Delivery of a set of AtomicSoftwareComponents including their Implementation.		
Description	Complete description of a set of AtomicSoftwareComponents including Implementation (still standalone, not yet mapped to a specific ECU). The source or object code files are referred by the Implementation Description. The atomic software components that make up the delivery may or may not form a composition (in the sense of the VFB). Note that the VFB descriptions of the components, compositions and the used interfaces are part of the deliverable too in order to describe the delivered components completely. However, depending on the use case, these parts could have been predefined and were treated as "readonly" during the component development. The same holds (optionally) for the Internal Behavior(s). A Timing Model and a mapping set between Application and Implementation Data Types are included optionally. The delivery can optionally also contain variants (an Evaluated Variant Set and the related artifacts).		
Kind	Delivered		
Relation Type	**Related Element**	**Mul.**	**Note**

Aggregates	VFB Modes	0..*	
Aggregates	VFB Types	0..*	
ProducedBy	Develop Application Software	1..*	
ConsumedBy	Configure RTE	1..*	Required input: • References to all component implementation descriptions on this ECU • SwcInternalBehavior (for example to map the runnables to tasks) which was used in the contract phase of the software components on this ECU

Relation Type	*Related Element*	*Mul.*	*Note*
ConsumedBy	Generate RTE	1..*	Required input: • References to all component implementation descriptions on this ECU • SwcInternalBehavior which was used in the contract phase of the software components on this ECU
ConsumedBy	Integrate Software for ECU	1..*	
ConsumedBy	Define Alias Names	0..1	Needed for definition of alias names in the scope of delivered software components.

Table 3.147: Delivered Atomic Software Components

3.4.2.2 Software Component Internal Behavior

Artifact	**Software Component Internal Behavior**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Description of the InternalBehavor: It describes the RTE relevant aspects of a component, for example the runnable entities and the events they respond to.		
Description	Description of the Internal Behavor. The Internal Behavior of an atomic software component describes the RTE relevant aspects of a component, i.e. the runnable entities and the events they respond to. It is used to generate the RTE but also as input for parts of the basic software generation (AUTOSAR Services). The Internal Behavior (i.e. the XML description) can only be used together with an Atomic Software Component Type to which it is related.		
Kind	AUTOSAR XML		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	Delivered Atomic Software Components	1..*	
ProducedBy	Define Atomic Software Component Internal Behavior	1	
ConsumedBy	Define Software Component Timing	1

Table 3.148: Software Component Internal Behavior

3.4.2.3 Atomic Software Component Implementation

Artifact	**Atomic Software Component Implementation**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Description of an implementation for a single atomic software component.		
Description	Description of an implementation for a single atomic software component. It is possible to have several different implementations for the same Software Component Internal Behavior, but only one implementation can be mapped to a particular ECU. In general, this XML artifact relates to one particular version of the code. It contains the version information as defined by the vendor. An implementation description may depend on several non-AUTOSAR artifacts, especially its own code files (source or object) but also required libraries, generator tools etc. These dependencies are not described by direct references to files (because this might be ambiguous), but by referring entries in the container catalog of the General Deliverable which contains the implementation artifacts. Such a reference is described via the metamodel element AutosarEngineeringObject (see AUTOSAR_TPS_GenericStructureTemplate.pdf for further description). This allows among other things to refer to a particular version of an artifact. For more information on the content of the implmementation description refer to AUTOSAR_TPS_BSWModuleDescriptionTemplate.pdf.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	1..*	
ProducedBy	Create Service Component	1	In order to generate the RTE, one needs to create a kind of dummy Implementation element for the Service Component, however this should not be filled with descriptive elements, e.g. resource consumption, as these are already defined by the Basic Software Module Implementation Description.
ProducedBy	Implement Atomic Software Component	1	
ProducedBy	Measure Resources	0..*	Add extensions to the Implementation Description.
ParameterInOut	Measure Component Resources	1	
ConsumedBy	Generate Component Header File in Vendor Mode	1	
ConsumedBy	Generate SWC Memory Mapping Header	1	MemorySections defined for an atomic software component.

Table 3.149: Atomic Software Component Implementation

3.4.2.4 Software Component Documentation

Artifact	**Software Component Documentation**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Documentation dedicated to a Software Component.		
Description	Documentation of a dedicated Software Component. This documentation is following the ASAM FSX standard. In this documentation, you will find the SW Feature definition and description which define the physical functionality of the Swc, the SW test description which will contains suggestions and hints for the test of the software functionality of the Swc, the SW calibration notes which will give calibration instructions and hints for a calibration engineer, some maintenance, diagnosis and CARB notes which will bring general information, on the maintenance diagnosis and CARB issues on the Swc. For other description not listed previously, some notes (chapters) are left free for that. This artifact may also contain standalone documentation (meta-class Documentation) not aggregeted by a specific software component.		
Kind	AUTOSAR XML		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	Delivered Atomic Software Components	0..*	
ParameterInOut	Add Documentation to the Software Component	1	
atpUseMetaModelElement	Documentation	1	
atpUseMetaModelElement	SwComponent Documentation	1	

Table 3.150: Software Component Documentation

3.4.2.5 Software Component Timing

Artifact	Software Component Timing		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Software Component's TimingDescription and TimingConstraints		
Description	TimingDescription and TimingConstraints of a software component. A software component can either be of type AtomicSWComponentType or CompositionSWComponentType. In the former case, the SwcTiming allows to describe timing description and constraints for the InternalBehavior of the AtomicSWComponentType. In the latter case, timing descriptions and constraints can be defined for all atomic software components in the CompositionSWComponentType.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	
ProducedBy	Define Software Component Timing	1	
ConsumedBy	Define System Timing	0..1	
ConsumedBy	Implement Atomic Software Component	0..1	
ConsumedBy	Measure Component Resources	0..1	
atpUseMetaModelElement	SwcTiming	1	

Table 3.151: Software Component Timing

3.4.2.6 Software Component to BSW Mapping

Artifact	Software Component to BSW Mapping		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Desribes how to map a software component to basic software elements (required in special cases only).		
Description	Maps an SwcInternalBehavior to an BswInternalBehavior. This is required to coordinate the API generation and the scheduling for service components, ECU abstraction components and complex driver components by the RTE and the BSW scheduling mechanisms.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	

Relation Type	*Related Element*	*Mul.*	*Note*
ProducedBy	Map Software Component to BSW	1	
ProducedBy	Create Service Component	0..1	
atpUseMetaModelElement	SwcBswMapping	1	

Table 3.152: Software Component to BSW Mapping

3.4.2.7 Partial Flat Map

Artifact	**Partial Flat Map**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description			
Description	The Partial Flat Map pre-defines Flat Map entries in the context of delivered software components. This allows the component developer to specify names of data instances for measurement and calibration. It has to be integrated into the System Flat Map. For more information on the Flat Map concept refer to artifact System Flat Map in the system domain.		
Kind	AUTOSAR XML		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	Delivered Atomic Software Components	0..1	
ProducedBy	Define Partial Flat Map	1	
ConsumedBy	Add Documentation to the Software Component	0..1	Optional input in order to refer to unique names defined in component or composition context.
ConsumedBy	Generate or Adjust ECU Flat Map	0..*	If Partial Flat Maps were delivered along with software components referring only to ECU internal information, they may be integrated into the ECU Flat Map directly, i.e. without needing the System Flat Map. • The instance refs used in a partial flat map must be taken over and adjusted to the context ECU Extract. • Name conflicts have to be resolved if several partial flat maps are merged.

Relation Type	***Related Element***	***Mul.***	***Note***
ConsumedBy	Generate or Adjust System Flat Map	0..*	If Partial Flat Maps were delivered along with software components, they must be integrated into the System Flat Map: • The instance refs used in a partial flat map must be taken over and adjusted to the context of the System or System Extract. • Name conflicts have to be resolved if several partial flat maps are merged.
atpUseMetaModelElement	FlatMap	1	

Table 3.153: Partial Flat Map

3.4.2.8 Application Header File

Artifact	**Application Header File**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Header generated for an AtomicSoftwareComponentType in the RTE contract phase.		
Description	Header generated for an AtomicSoftwareComponentType in the RTE contract phase. It represents the complete source-code interface between the component code and RTE (calls into the RTE as well as protoypes called by the RTE). All communication of the component code with other components is routed through this header.		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	1..*	
ProducedBy	Generate Atomic Software Component Contract Header Files	1	
ConsumedBy	Compile Atomic Software Component	1	
ConsumedBy	Implement Atomic Software Component	1	
ConsumedBy	Compile ECU Source Code	1..*	

Table 3.154: Application Header File

3.4.2.9 Software Component Data Types Header

Artifact	**Software Component Data Types Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Software Component Data Types Header provided by the RTE in the contract phase.		
Description	Software Component Data Types Header provided by the RTE in the contract phase. This includes data types, which were declared as part of the SWC description but not used in any ports or data elements.		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	1..*	
ProducedBy	Generate Atomic Software Component Contract Header Files	1	
ProducedBy	Generate Component Header File in Vendor Mode	1	
ConsumedBy	Compile Atomic Software Component	1	
ConsumedBy	Implement Atomic Software Component	1	
ConsumedBy	Compile ECU Source Code	0..*	

Table 3.155: Software Component Data Types Header

3.4.2.10 Component RTE Prebuild Configuration Header

Artifact	**Component RTE Prebuild Configuration Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Generated header file used to resolve the prebuild variants in the prebuild RTE contract phase for an SWC.		
Description	Generated header file used to resolve the prebuild variants of a software component in the prebuild RTE contract phase. Contains macros which resolve the variants when compiled with the module and the generated RTE.		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	
ProducedBy	Generate Component Prebuild Data Set	1	

Relation Type	Related Element	Mul.	Note
ConsumedBy	Compile Atomic Software Component	0..1

3.4.2.11 E2E Protection Wrapper Header File

Artifact	**E2E Protection Wrapper Header File**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description			
Description	This header replaces the RTE API in order to do safe communication over ports. It redirects the calls from a software component to the RTE so that the E2E Protection Wrapper is executed.		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	Delivered Atomic Software Components	0..*	
ProducedBy	Generate E2E Protection Wrapper	1	
ConsumedBy	Compile Atomic Software Component	0..1	

Table 3.157: E2E Protection Wrapper Header File

3.4.2.12 E2E Protection Wrapper Source Code

Artifact	E2E Protection Wrapper Source Code		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description			
Description	A piece of code that is placed between software components and the RTE in order to provide E2E safety over ports. For data elements with specified E2E safety, the wrapper takes care • that the appropriate signature is added to the data if the data is written to the RTE • that the signature is checked if the data is read from the RTE Typically it uses a specific library to perform these actions.		
Kind	Code		
Relation Type	**Related Element**	**Mul.**	**Note**
AggregatedBy	Delivered Atomic Software Components	0..*	
ProducedBy	Generate E2E Protection Wrapper	1	
ConsumedBy	Compile Atomic Software Component	0..1	

Table 3.158: E2E Protection Wrapper Source Code

3.4.2.13 Atomic Software Component Source Code

Artifact	Atomic Software Component Source Code		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Work Products		
Brief Description	Source code implementing an Atomic Software Component Type		
Description	Source code implementing an Atomic Software Component Type. In general it is independent from an ECU.		
Kind	Code

3.4.3 Tools

3.4.3.1 Component API Generator Tool

Tool	**Component API Generator Tool**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Component::Guidance		
Brief Description	Generates the software component contract header used to connect the software component to the RTE layer.		
Description	This guidance represents the so-called contract phase of the RTE generation process. • SWC Contract phase - a limited set of information about a component, principally the AUTOSAR interface definitions and the internal behavior, is used to create an application header file for a component type. The application header file defines the contract between component and RTE. • BSW Contract phase - a similar use case for a BSW module in order to generate the module interlink header files, which are used to interface between the module and the BSW Scheduler. • Additional phases - for SWS and BSW as well - are used to bind pre-build variants in the contract headers of a single Software Component or BSW module.

3.5 Basic Software

This chapter contains the definition of work products and tasks used for the development of Basic Software modules. For the definition of the relevant meta-model elements refer to [10].

3.5.1 Tasks

3.5.1.1 Define BSW Types

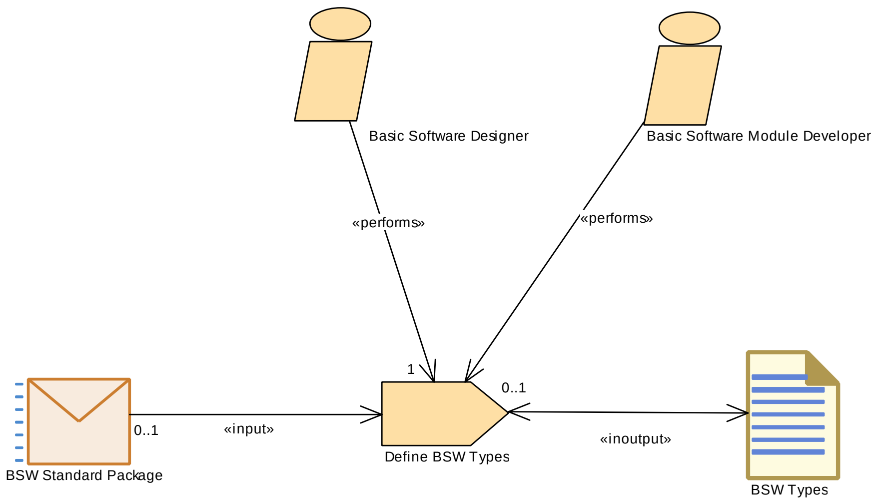

Figure 3.80: Define BSW Types

Task Definition	**Define BSW Types**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Define data types for usage within the Basic Software.		
Description	A data type is typically based on elements standardized by AUTOSAR, therefore BSW Standard Package appears as a mandatory input.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Designer	1	

Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Module Developer	1	
Consumes	BSW Standard Package	0..1	
ParameterInOut	BSW Types	1	

Table 3.164: Define BSW Types

3.5.1.2 Define BSW Entries

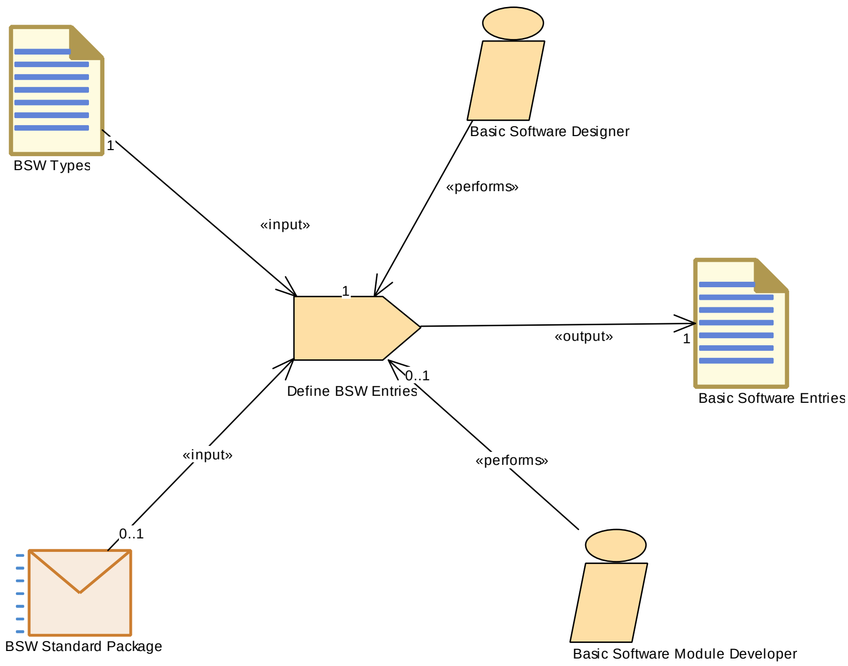

Figure 3.81: Define BSW Entries

Task Definition	**Define BSW Entries**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Define BswEntries (= function signatures) for usage within the Basic Software.		
Description			
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Designer	1	
Performer	Basic Software Module Developer	1	
Consumes	BSW Types	1	
Consumes	BSW Standard Package	0..1	
Produces	Basic Software Entries	1	

Relation Type	*Related Element*	*Mul.*	*Note*

Table 3.165: Define BSW Entries

3.5.1.3 Define BSW Interfaces

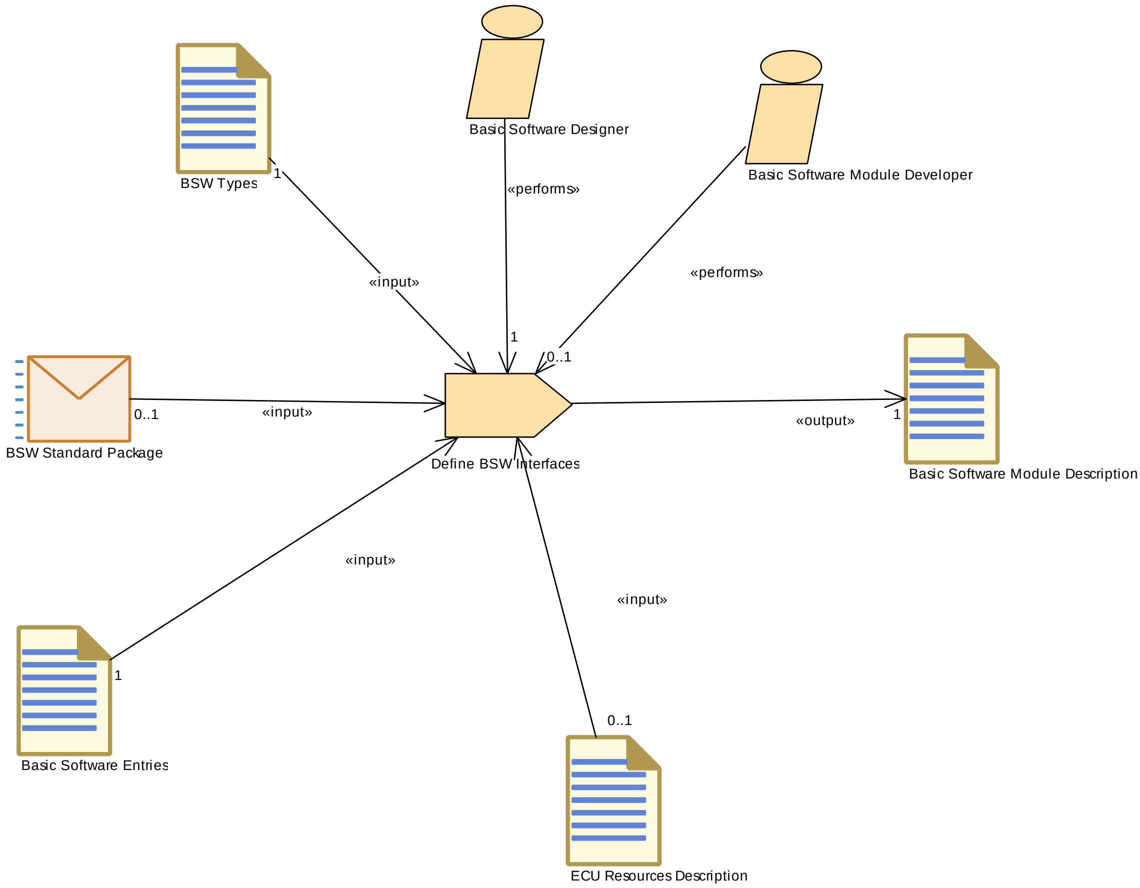

Figure 3.82: Define BSW Interfaces

Task Definition	**Define BSW Interfaces**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Define the interfaces for a single BSW Module.		
Description	Define the interfaces for a particular BSW Module or cluster as part of the BSW Module Description. This includes an abstraction of the required and provided C-functions, as well as triggers and modes. Note that this task also exists for modules standardized by AUTOSAR, as it may be required to decide on optional or alternative elements and to add allowed project specific extensions.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Designer	1	
Performer	Basic Software Module Developer	1	
Consumes	BSW Types	1	

Relation Type	Related Element	Mul.	Note
Consumes	Basic Software Entries	1	
Consumes	BSW Standard Package	0..1	
Consumes	ECU Resources Description	0..1	
Produces	Basic Software Module Description	1	

Table 3.166: Define BSW Interfaces

3.5.1.4 Define Vendor Specific Module Definition

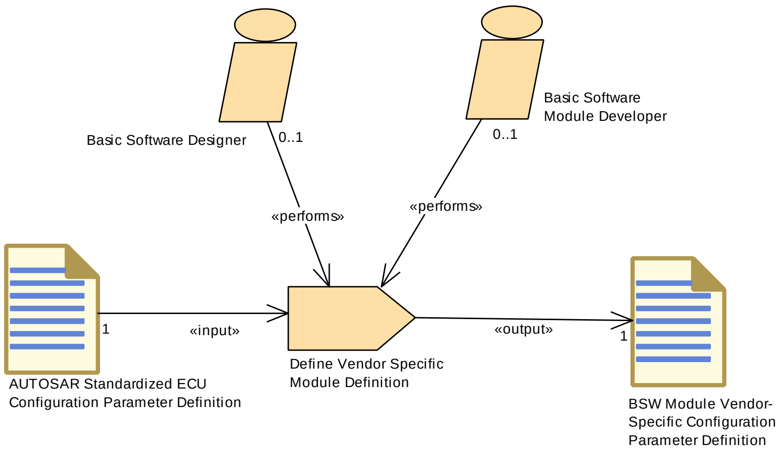

Figure 3.83: Define Vendor Specific Module Definition

Task Definition	Define Vendor Specific Module Definition		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description			
Description	Define the Vendor Specific Module Definition (=Configuration Parameters).		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Basic Software Designer	0..1	
Performer	Basic Software Module Developer	0..1	
Consumes	AUTOSAR Standardized ECU Configuration Parameter Definition	1	
Produces	BSW Module Vendor-Specific Configuration Parameter Definition	1	

Relation Type	*Related Element*	*Mul.*	*Note*

Table 3.167: Define Vendor Specific Module Definition

3.5.1.5 Define BSW Behavior

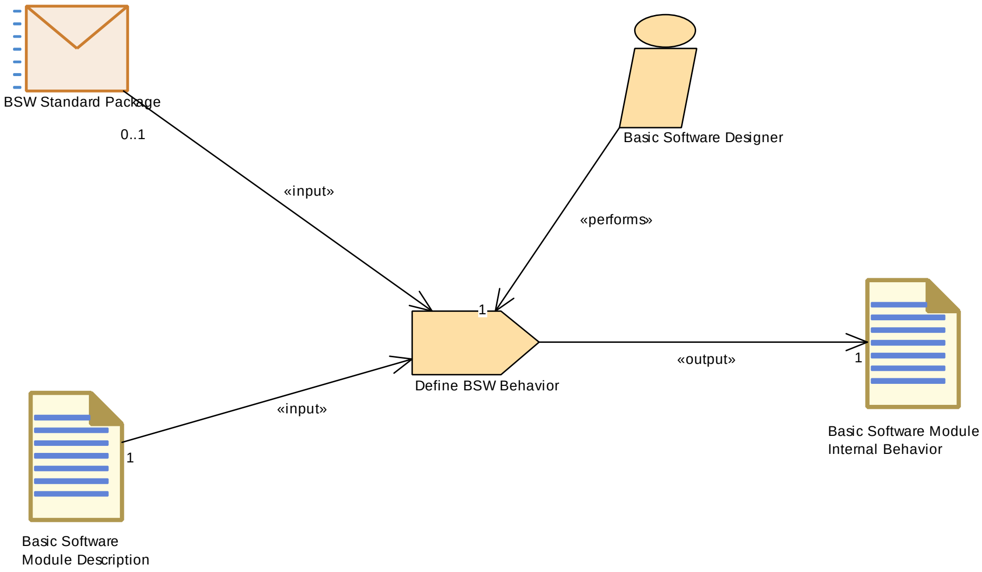

Figure 3.84: Define BSW Behavior

Task Definition	**Define BSW Behavior**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Define the BSW Behavior related to a BSW Module Description.		
Description	Define the BSW Behavior related to a BSW Module Description. This task is required during BSW module development in order to be able to generate the API to the BSW Scheduler. In addition, local data (variables or parameters) may be defined during this task in order to use the AUTOSAR data type system for module local data and to generate measurement & calibration support.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	Basic Software Designer	1	
Consumes	Basic Software Module Description	1	
Consumes	BSW Standard Package	0..1	
Produces	Basic Software Module Internal Behavior	1	

Table 3.168: Define BSW Behavior

3.5.1.6 Define BSW Module Timing

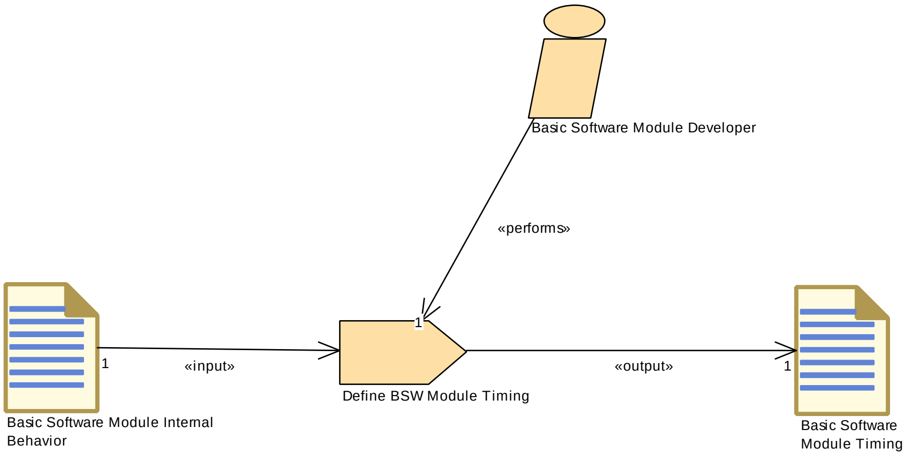

Figure 3.85: Define BSW Module Timing

Task Definition	**Define BSW Module Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Define BSWModuleTiming (TimingDescription and TimingConstraints) for the Internal Behavior (BSWModuleEntities) of a BSW module		
Description	Define BSWModuleTiming (TimingDescription and TimingConstraints) for the Internal Behavior (BSWModuleEntities) of a BSW module		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Basic Software Module Developer	1	
Consumes	Basic Software Module Internal Behavior	1	
Produces	Basic Software Module Timing	1	

Table 3.169: Define BSW Module Timing

3.5.1.7 Generate BSW Contract Header Files

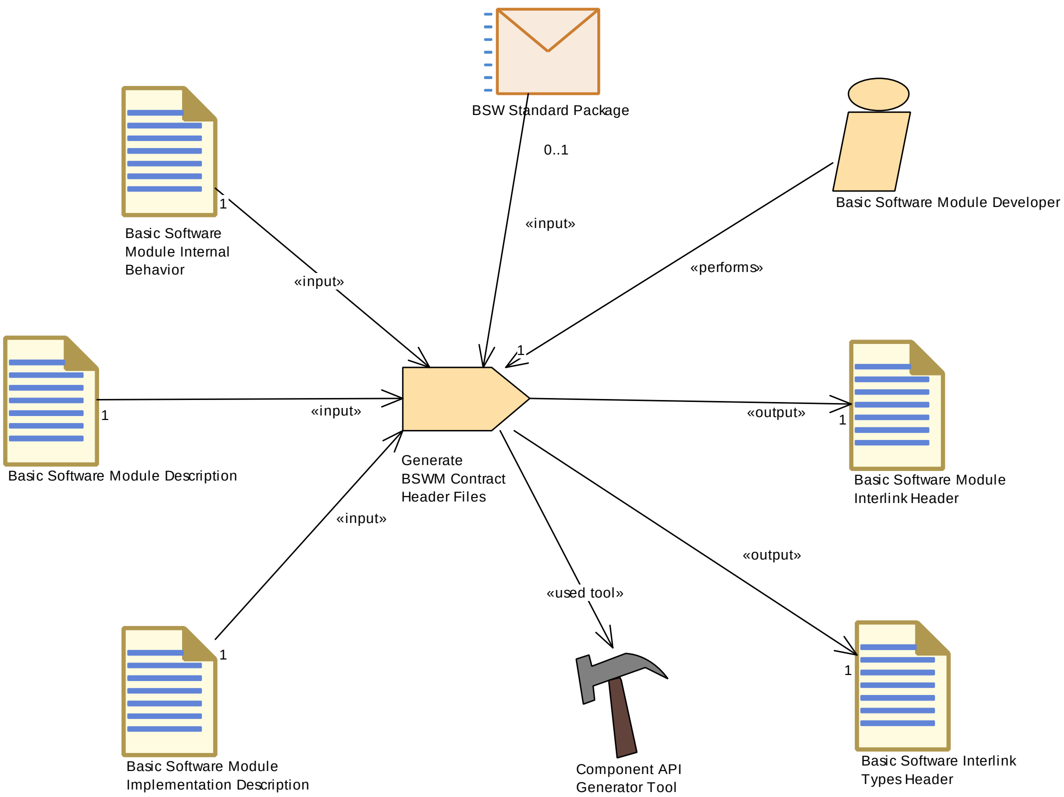

Figure 3.86: Generate BSW Contract Header Files

Task Definition	**Generate BSWM Contract Header Files**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Generate Basic Softwaree Module Contract Header Files		
Description	Generate the header files needed for a BSW module as part of the so-called "contract phase". These headers will allow to link the module lateron with the RTE (namely the BSW Scheduler).		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Basic Software Module Developer	1	
Consumes	Basic Software Module Description	1	
Consumes	Basic Software Module Implementation Description	1	
Consumes	Basic Software Module Internal Behavior	1	
Consumes	BSW Standard Package	0..1	
Produces	Basic Software Interlink Types Header	1	

Relation Type	*Related Element*	*Mul.*	*Note*
Produces	Basic Software Module Interlink Header	1	
UsedTool	Component API Generator Tool	1	

Table 3.170: Generate BSWM Contract Header Files

3.5.1.8 Implement a BSW Module

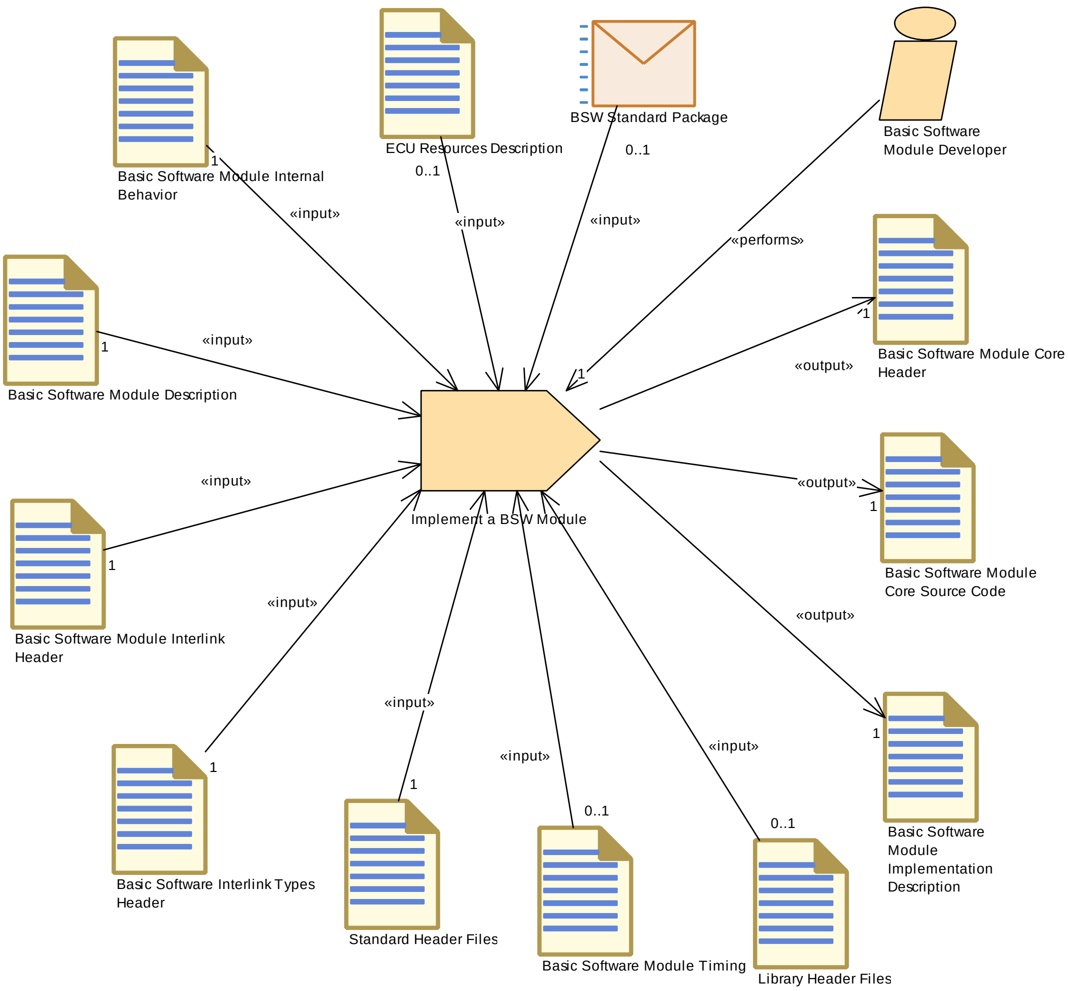

Figure 3.87: Implement a BSW Module

Task Definition	**Implement a BSW Module**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Implement the source code of a BSW module.		
Description	Implement the source code of a BSW module. This task is not described by AUTOSAR completely, but included for completeness of the AUTOSAR use cases. Note that specification of an AUTOSAR standard module imposes several requirements, e.g. the inclusion of certain header files, onto this task. In addition to the code, this task also produces the necessary XML descriptions.		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	Basic Software Module Developer	1	
Consumes	Basic Software Interlink Types Header	1	
Consumes	Basic Software Module Description	1	
Consumes	Basic Software Module Interlink Header	1	
Consumes	Basic Software Module Internal Behavior	1	
Consumes	Standard Header Files	1	
Consumes	BSW Standard Package	0..1	
Consumes	Basic Software Module Timing	0..1	
Consumes	ECU Resources Description	0..1	
Consumes	Library Header Files	0..1	
Produces	Basic Software Module Core Header	1	
Produces	Basic Software Module Core Source Code	1	
Produces	Basic Software Module Implementation Description	1	

Table 3.171: Implement a BSW Module

3.5.1.9 Develop BSW Module Generator

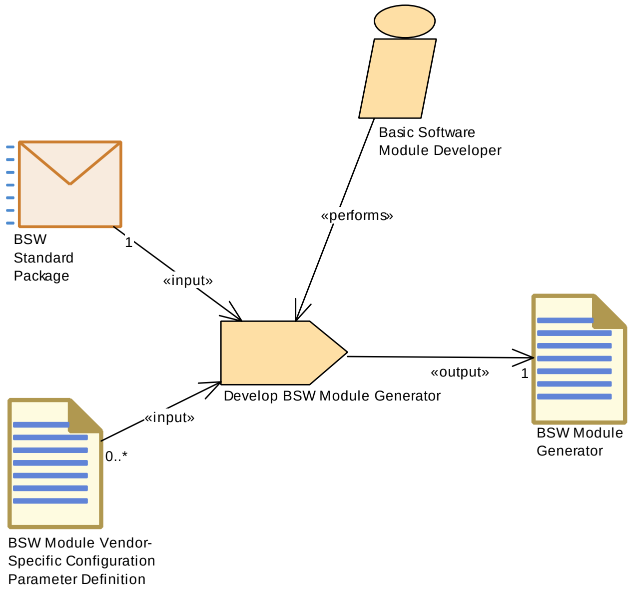

Figure 3.88: Develop BSW Module Generator

Task Definition	**Develop BSW Module Generator**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description			
Description	Develop a generator for one or more BSW modules.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Basic Software Module Developer	1	
Consumes	BSW Standard Package	1	
Consumes	BSW Module Vendor-Specific Configuration Parameter Definition	0..*	
Produces	BSW Module Generator	1	

Table 3.172: Develop BSW Module Generator

3.5.1.10 Create Library

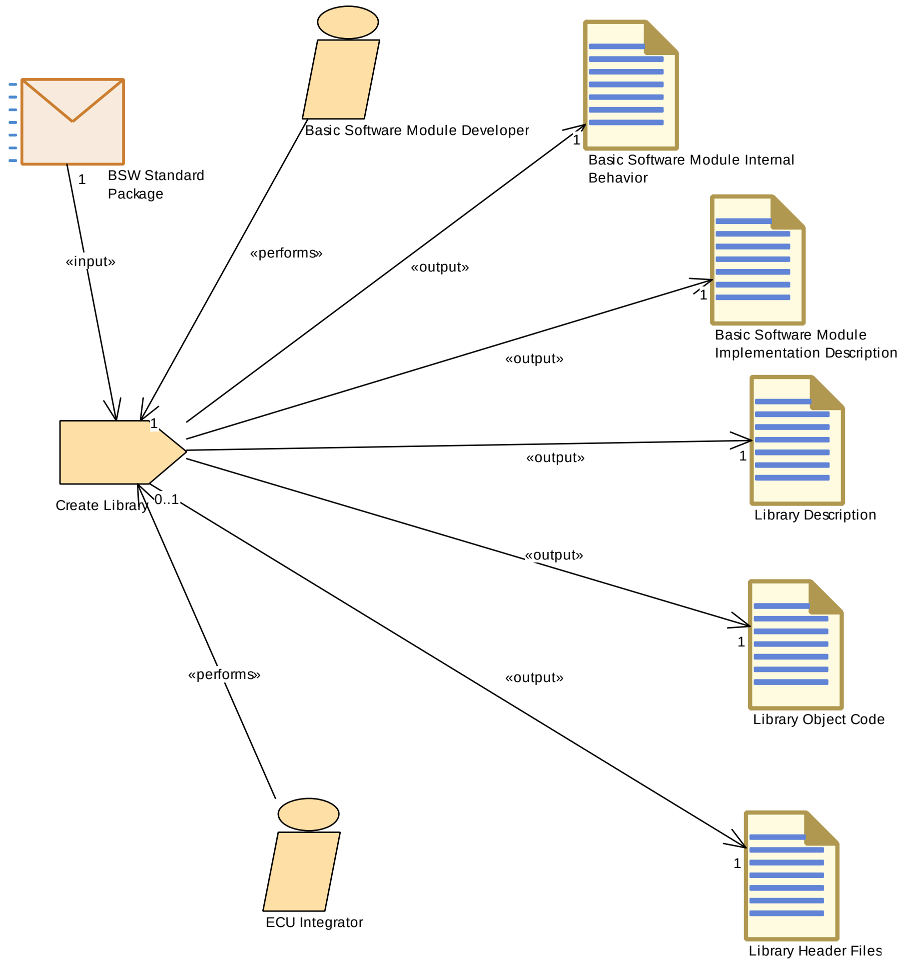

Figure 3.89: Create Library

Task Definition	**Create Library**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Create a library to be used within an Autosar ECU.		
Description	Create a non-standardized library to be used within an Autosar ECU. The task is the same for the basic software and application level, but it is considered as a basic software task because no VFB resp. RTE abstraction is used. The output includes source code, header file and XML descriptions of the interfaces and of the implementation. A "dummy" BSW Behavior must be created too in order to be able to link the other two XML artifacts.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Basic Software Module Developer	1	
Performer	ECU Integrator	1	
Consumes	BSW Standard Package	1	Used for standard types and specifications.

Relation Type	*Related Element*	*Mul.*	*Note*
Produces	Basic Software Module Implementation Description	1	
Produces	Basic Software Module Internal Behavior	1	
Produces	Library Description	1	
Produces	Library Header Files	1	
Produces	Library Object Code	1	

Table 3.173: Create Library

3.5.1.11 Compile BSW Core Code

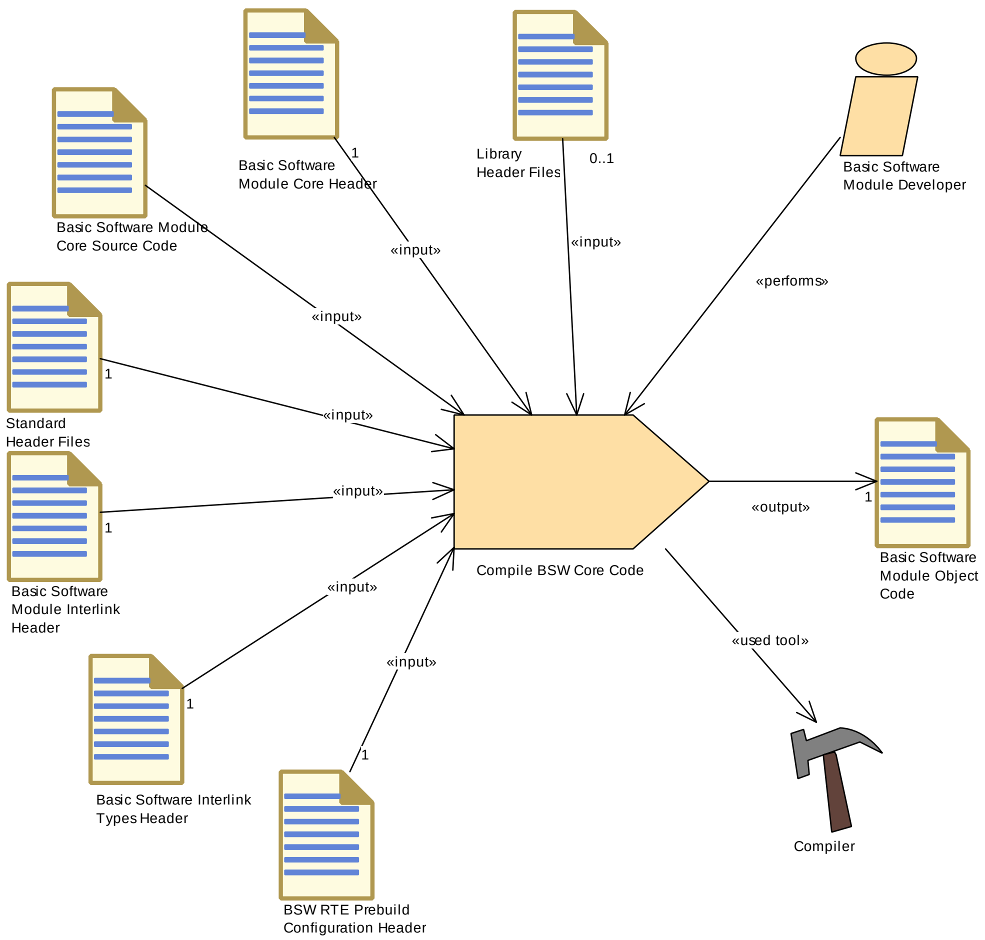

Figure 3.90: Compile BSW Core Code

Task Definition	**Compile BSW Core Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Tasks		
Brief Description	Compile the source code of a BSW modue without ECU specific configurations.		
Description	Compile the source code of a BSW modue without ECU specific configurations. This task is mainly used to describe the use cases of BSW development for object code delivery. The output will only represent the "core code". During ECU integration, additional generated code may be added per module in response to ECU configuration.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	Basic Software Module Developer	1	
Consumes	BSW RTE Pre-build Configuration Header	1	
Consumes	BSW Types	1	
Consumes	Basic Software Interlink Types Header	1	
Consumes	Basic Software Module Core Header	1	
Consumes	Basic Software Module Core Source Code	1	
Consumes	Basic Software Module Interlink Header	1	
Consumes	Standard Header Files	1	
Consumes	Library Header Files	0..1	
Produces	Basic Software Module Object Code	1	
UsedTool	Compiler	1

3.5.2 Work Products

3.5.2.1 BSW Standard Package

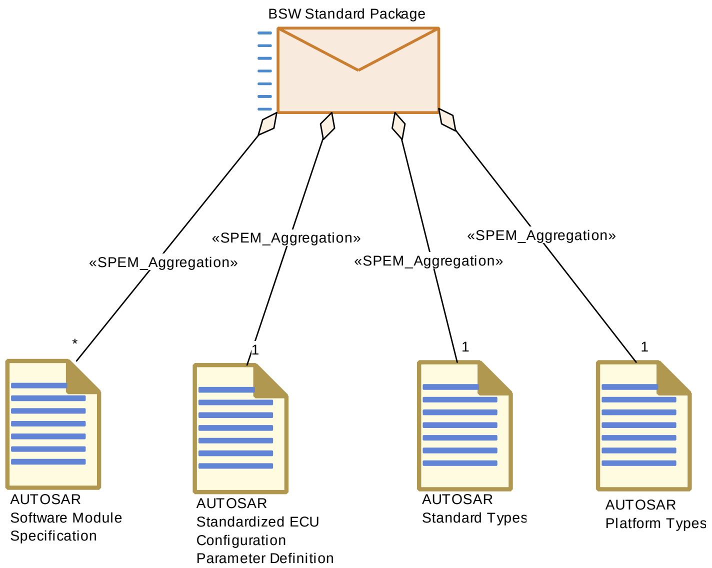

Figure 3.92: BSW Standard Package

Deliverable	**BSW Standard Package**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description	Package containing standard artifacts for BSW.		
Description	Contains the standard specifications and standard ARXML artifacts to be used within the AUTOSAR basic software and for the generation of the RTE. This deliverable is released by AUTOSAR and is readonly within the methodology.		
Kind	Delivered		
Relation Type	**Related Element**	**Mul.**	**Note**
Aggregates	AUTOSAR Platform Types	1	
Aggregates	AUTOSAR Standard Types	1	
Aggregates	AUTOSAR Standardized ECU Configuration Parameter Definition	1	
Aggregates	AUTOSAR Software Module Specification	0..*

3.5.2.2 BSW Module Bundle

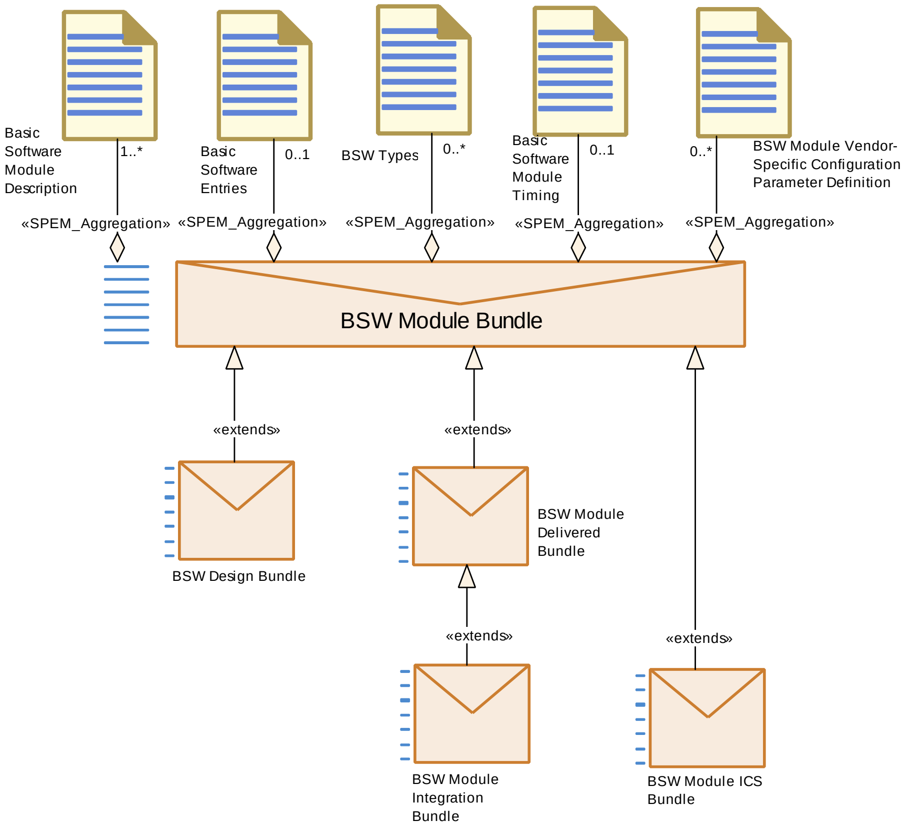

Figure 3.93: BSW Module Bundle

Deliverable	**BSW Module Bundle**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description			
Description	Generic deliverable representing a bundle of one or more BSW modules. It is used as a basis for extended deliverables. The deliverable aggregates the ARXML definitions on the interface level including vendor specific configuration parameter definition. According to the role of the extended deliverable, these elements maybe blueprints completely or partially. .		
Kind	Delivered		
Extended By	BSW Design Bundle, BSW Module Delivered Bundle, BSW Module IC S Bundle		
Relation Type	***Related Element***	***Mul.***	***Note***

ConsumedBy	Define Integration Variant	1..*	
ConsumedBy	Generate Base Ecu Configuration	1..*	Need vendor specific configuration parameters and their recommended or pre-configured values.
ConsumedBy	Integrate Software for ECU	1..*	
ConsumedBy	Configure Com	0..1	
ConsumedBy	Configure Diagnostics	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ConsumedBy	Configure MCAL	0..1	

Relation Type	*Related Element*	*Mul.*	*Note*
ConsumedBy	Configure Mode Management	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ConsumedBy	Configure NvM	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ConsumedBy	Configure Watchdog Manager	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ConsumedBy	Create Service Component	0..1	Required in order to define a mapping between SWC and BSW.
ConsumedBy	Configure Debug	0..*	
ConsumedBy	Configure ECUC	0..*	
ConsumedBy	Configure IO Hardware abstraction	0..*	
ConsumedBy	Configure OS	0..*	
ConsumedBy	Configure RTE	0..*	Input from the BSW Module Description is needed related to Scheduling, Exclusive Areas, Triggers and Modes.

Table 3.180: BSW Module Delivered Bundle

3.5.2.6 AUTOSAR Software Module Specification

Artifact	**AUTOSAR Software Module Specification**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description	The standard sofware module specification.		
Description	Specification of a standardized Basic Software Module (SWS). It is published as a textual specification, but can be seen as a Basic Software Design bundle in the methodology, consisting mainly of blueprints. It may be published as ARXML in future releases of AUTOSAR.		
Kind	text		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	BSW Standard Package	0..*	

Table 3.181: AUTOSAR Software Module Specification

3.5.2.7 AUTOSAR Standard Types

Artifact	**AUTOSAR Standard Types**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description	Contains all the standardized module definition parameters.		
Description	ARXML description of the AUTOSAR standard types (e.g. Std_ReturnType).		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	BSW Standard Package	1	
AggregatedBy	VFB AUTOSAR Standard Package	1

3.5.2.9 BSW Module Generator

Artifact	**BSW Module Generator**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description			
Description	A generator that comes as part of one or more delivered BSW modules. It can be put into a framework to let it generate a module's configuration code.		
Kind			
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	BSW Module Delivered Bundle	0..*	
ProducedBy	Develop BSW Module Generator	1	
ConsumedBy	Generate BSW Configuration Code	0..1	This is an input in case a generator framework is used which has to run some module specific generator code.

Table 3.184: BSW Module Generator

3.5.2.10 AUTOSAR Standardized ECU Configuration Parameter Definition

Artifact	**AUTOSAR Standardized ECU Configuration Parameter Definition**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description	Contains all the standardized module definition parameters.		
Description	Contains all the standardized module definition parameters. These parameters must be referred by the vendor specific configuration of a specific module.		
Kind	AUTOSAR XML		
Relation Type	*Related Element*	*Mul.*	*Note*
AggregatedBy	BSW Standard Package	1

3.5.2.12 BSW Module Recommended Configuration

Artifact	**BSW Module Recommended Configuration**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Bsw::Work products		
Brief Description	Recommended "default" configuration parameter values.		
Description	Set of configuration parameter values, which are recommended by the module vendor as a default, but are not mandatory for the integration. There can be more than one such set in order to allow for variable usage of the module. This artifact does not include values of so-called published parameters. These must always be given as Basic Software Module Preconfigured Configuration.

3.6 ECU Integration and Configuration

This chapter contains the definition of work products and tasks used for the integration and configuration of AUTOSAR software on an ECU. For the definition of the relevant meta-model elements refer to [5].

3.6.1 Tasks

3.6.1.1 Provide RTE Calibration Dataset

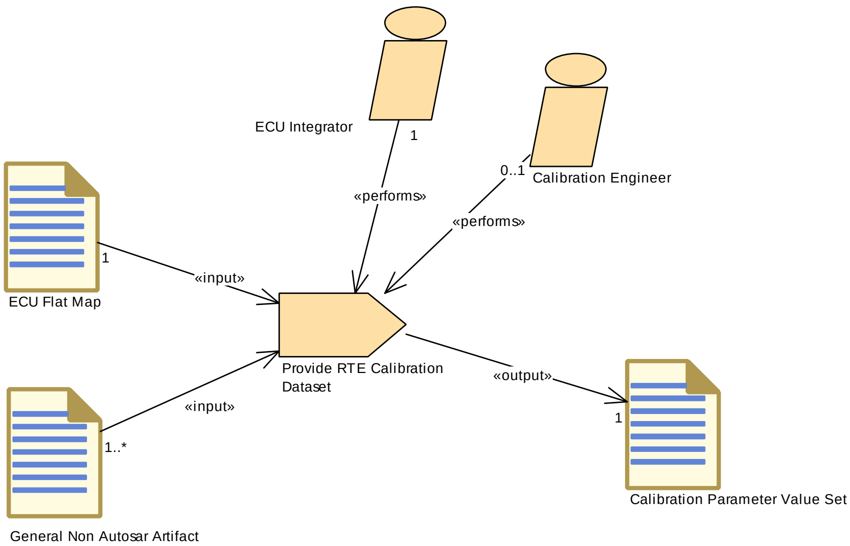

Figure 3.96: Provide RTE Calibration Dataset

Task Definition	**Provide RTE Calibration Dataset**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Provide a data set defining initial values for calibration parameters in the RTE code.		
Description	Since a model of the "downstream" calibration process of an ECU is not part of the AUTOSAR methodology, the input data are only shown as a General Non AUTOSAR Artifact. The output of this task is a set of calibration values in AUTOSAR format, which can be further processed within AUTOSAR, namely by the RTE generator. The calibration values have to be associated to the corresponding parameter specification via a reference to the ECU Flat Map.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Performer	Calibration Engineer	0..1	
Consumes	ECU Flat Map	1	
Consumes	General Non Autosar Artifact	1..*	input from calibration process
Produces	Calibration Parameter Value Set	1	

Table 3.204: Provide RTE Calibration Dataset

3.6.1.2 Define Integration Variant

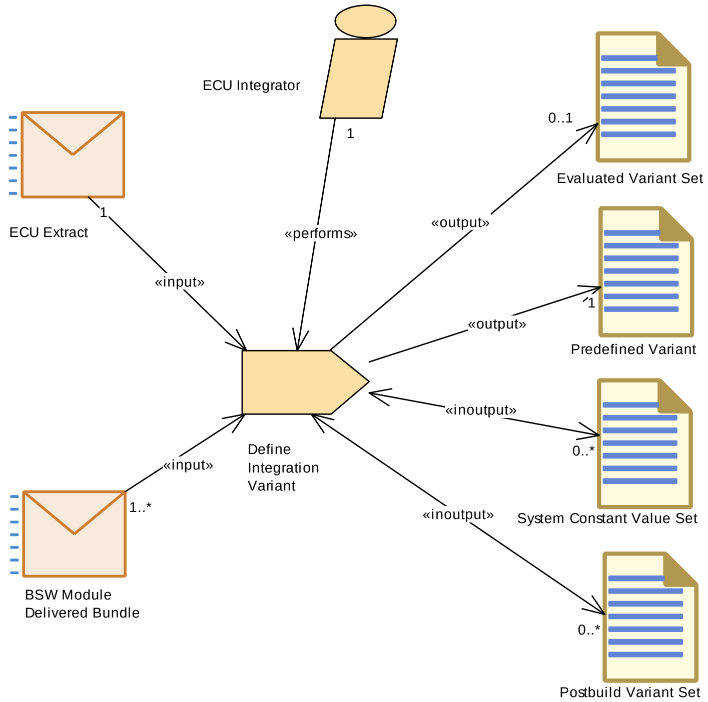

Figure 3.97: Define Integration Variant

Task Definition	**Define Integration Variant**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Define a variant for the artifacts integrated on an ECU.		
Description	Define a variant for the artifacts integrated on an ECU, this means adding a PredefinedVariant related to the ECU extract and the BSW modules in scope. To do so, this task can make use of existing System Constant Value Set and/or Postbuid Variant Sets or define new ones. Several PredefinedVariants can be combined to one Evaluated Variant Set. It is up to particular process definition to decide, which variants are allowed to be set at integration time. Technically, since this task is part of ECU integration, it can only resolve variation points which have not yet been resolved in the delivered ECU extract or BSW modules. Especially, variation points which have to be bound at system design time, should have been already resolved before.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	
Consumes	BSW Module Delivered Bundle	1..*	
ParameterInOut	Postbuild Variant Set	0..*	
ParameterInOut	System Constant Value Set	0..*	

Relation Type	*Related Element*	*Mul.*	*Note*
Produces	Predefined Variant	1	
Produces	Evaluated Variant Set	0..1	

Table 3.205: Define Integration Variant

3.6.1.3 Generate Base ECU Configuration

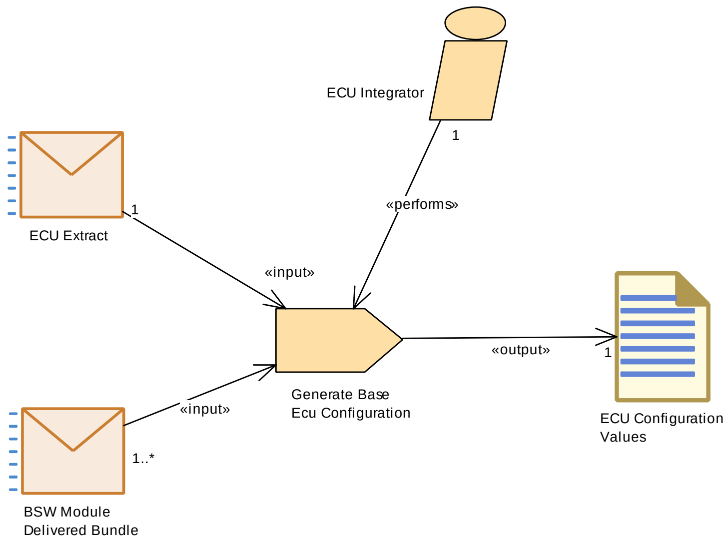

Figure 3.98: Generate Base ECU Configuration

Task Definition	**Generate Base Ecu Configuration**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Generate an initial set of ECU configuration values based on the delivered ECU extract.		
Description	Create the ECU configuration module structure including an initial set of ECU configuration values. This is based on the delivered ECU extract and on the vendor specific configuration parameters and their recommended or pre-configured values provided with the delivered BSW modules.		
Relation Type	*Related Element*	*Mul.*	*Note*
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	
Consumes	BSW Module Delivered Bundle	1..*	Need vendor specific configuration parameters and their recommended or pre-configured values.
Produces	ECU Configuration Values	1	

Table 3.206: Generate Base Ecu Configuration

3.6.1.4 Define ECU Timing

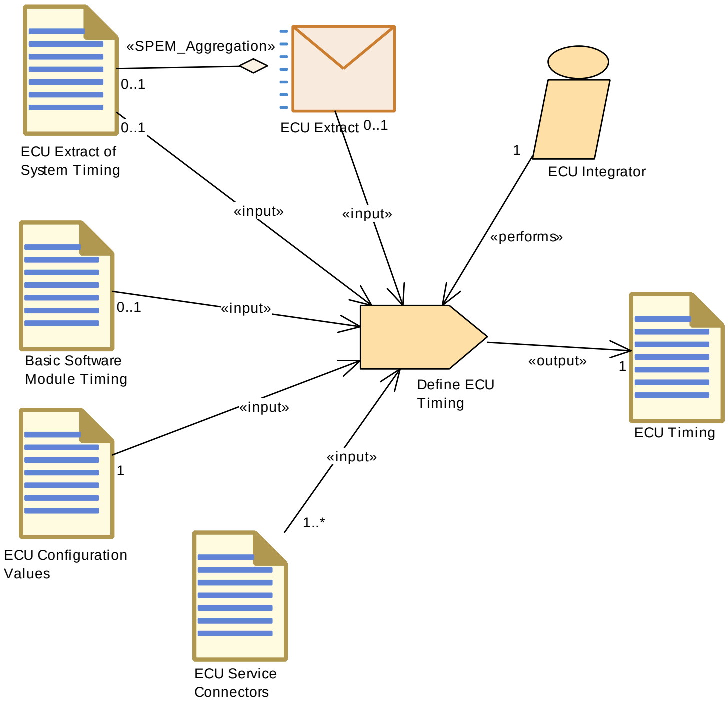

Figure 3.99: Define ECU Timing

Task Definition	**Define ECU Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Define ECUTiming (TimingDescription and TimingConstraints) for a concrete ECU taking the ECU configuration and the ECU Software Composition (including their implementation) into account.		
Description	Define ECUTiming (TimingDescription and TimingConstraints) for a concrete ECU taking the ECU configuration and the ECU Software Composition (including their implementation) into account.		
Relation Type	**_Related Element_**	**_Mul._**	**_Note_**
Performer	ECU Integrator	1

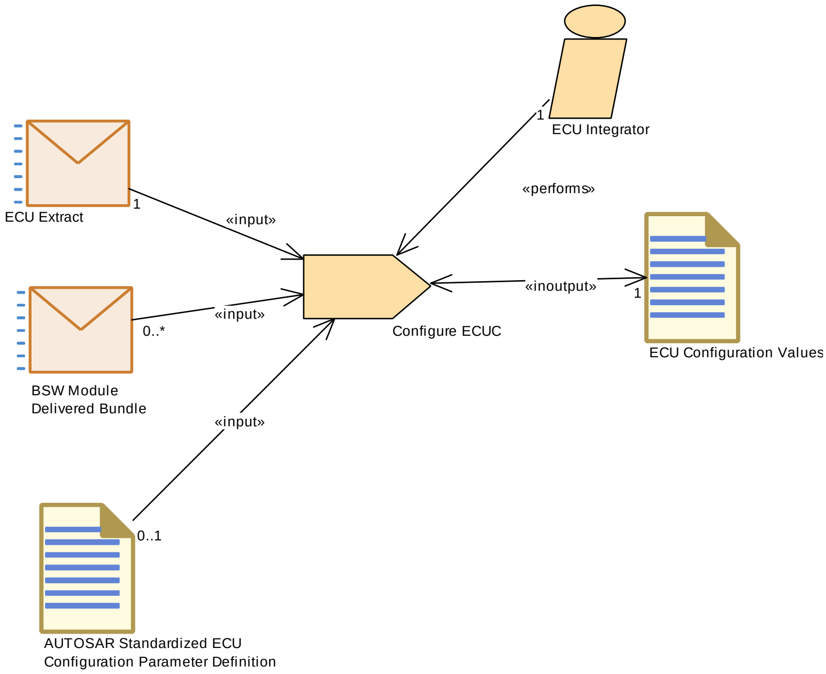

Figure 3.100: Configure EcuC

<table>
<tr><td>Task Definition</td><td colspan="3">Configure ECUC</td></tr>
<tr><td>Package</td><td colspan="3">AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks</td></tr>
<tr><td>Brief Description</td><td colspan="3">Set the general ECU configuration values.</td></tr>
<tr><td>Description</td><td colspan="3">Set the general ECU configuration values, the so-called EcuC parameters. These are the configuration parameters which are not related to a particular module, but are relevant for the ECU in general. The EcuC parameters consist of the following parts:
Collection of all Pdu objects flowing through the Com-Stack.
Definition of partitions for the ECU (One partition will be implemented using one OS application). The memory partitions have to be known before doing the OS configuration.
Collection of PredefinedVariant elements which shall be applied when resolving the variability during ECU Configuration.
Collection of mappings between ECU hardware memory segments (defined in ECU Resources Description) and SwAddrMethod elements (defined in VFB Types). The name of each such EcucMemoryMappingElement could be used as to predefine the logical memory segment for the linker configuration.
Note: The usage of EcucMemoryMappingElement is deprecated in R4.0 rev.2, because the configuration of the "memmap" module has been added which allows a more fined grained memory mapping than SwAddrmethod. A relatonship to hardware elements from this fine grained mapping is currently not provided. See task definition Configure Memmap Allocation.</td></tr>

</table>

Table 3.208: Configure ECUC

3.6.1.6 Configure OS

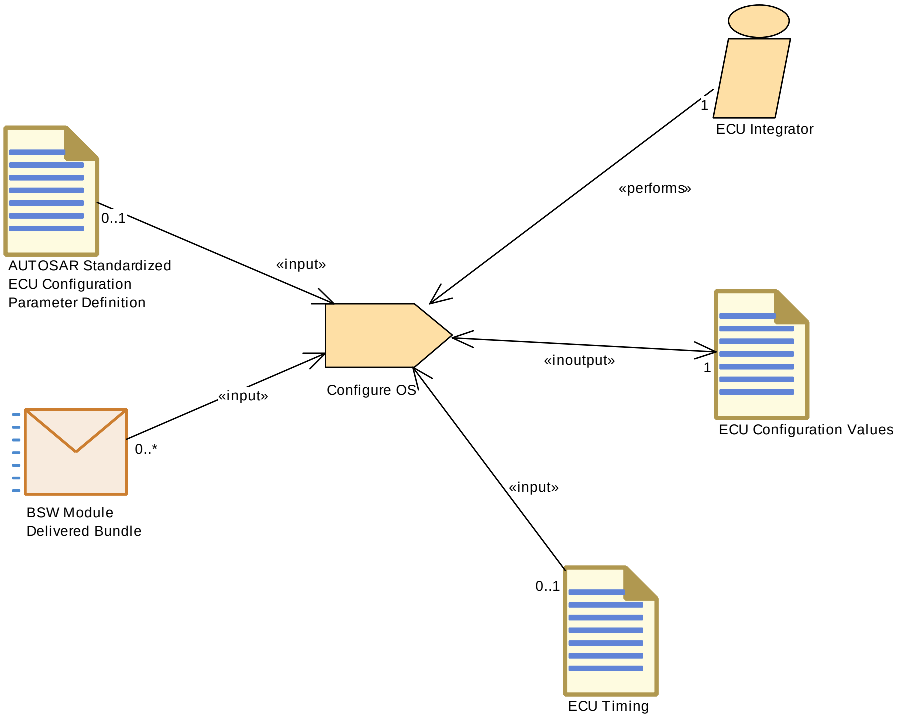

Figure 3.101: Configure OS

Task Definition	**Configure OS**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Configure the OS by creating the Tasks, events, alarms, etc.		
Description	The OS configuration process may be highly iterative between RTE and OS, e.g. RTE needs some OsTasks or OsScheduleTables to map Runnables into them. To finalize a ECU Configuration the OS is the last BSW module to configure (with the exception of the debugger). To use multi-core ECUs the EcuC Configuration needs to be provided beforehand to the OS Configuration to map the cores. There cannot be specified a precedence which configuration parameter values should be set first for OsAlarm, OsApplication, OsCounter, OsIsr, OsOs, OsResource, OsScheduleTable, OsSpinlock, OsTask. This is dependent on the development and configuration process. Application + Basic Software requirements and fulfill those with OS artifacts. Mandatory Inputs: • RTE part of the ECU Configuration • EcuC part of the ECU Configuration Outputs: • OS part of the ECU Configuration • RTE part of the ECU Configuration The following steps are needed to perform the task : • Map OS Configuration to Cores only in the case of multiple core ECU. • Define the OSTasks and OSSchedule : Tables based on the events/runnables of the application & bsw components, create the OSTasks that will invoke them. • Map Runnables into OSTasks and OSSchedule Tables : Assign all the runnables to the OSTasks • Steps for "OsAlarm, OsApplication, OsCounter, OsIsr, OsOs, OsResource, OsScheduleTable, OsSpinlock, OsTask."		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	AUTOSAR Standardized ECU Configuration Parameter Definition	0..1	
Consumes	ECU Timing	0..1	
Consumes	BSW Module Delivered Bundle	0..*	
ParameterInOut	ECU Configuration Values	1	

Table 3.209: Configure OS

3.6.1.7 Configure RTE

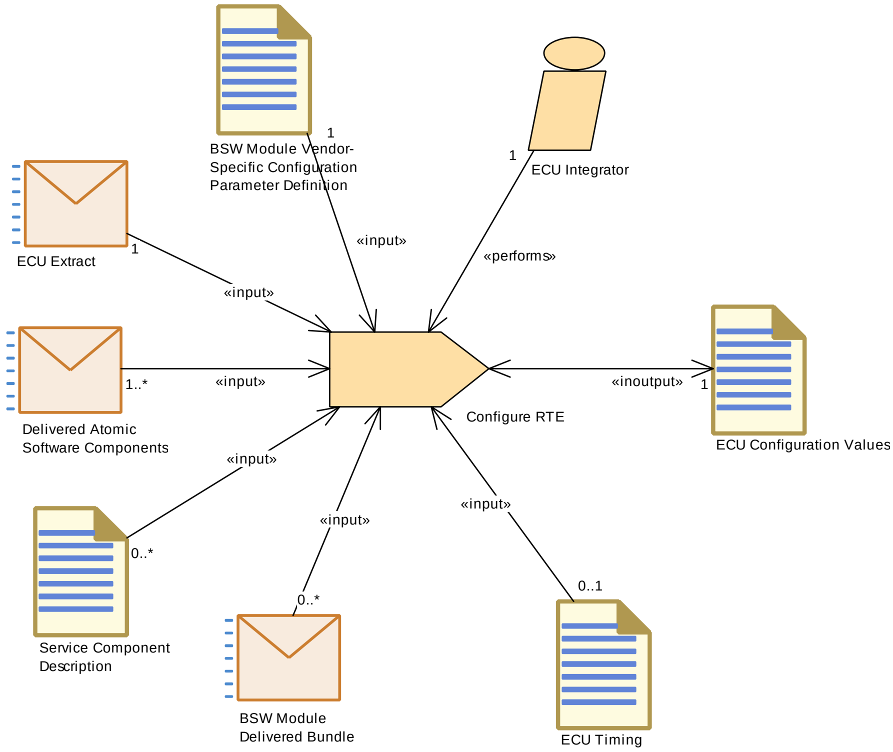

Figure 3.102: Configure RTE

Task Definition	**Configure RTE**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Describes the steps required to successfully configure the AUTOSAR RTE.		
Description	Configure the RTE to correctly interact with AUTOSAR COM and the OS. The specification of the OS objects used by the generated RTE are configured in this task. In addition, configuration includes setting RTE specific options and the handling of measurement and calibration data. Post-build variants which shall be supported by the RTE code must be referenced by the configuration. The following steps are usualy done to configure the RTE : 1.Setup RTE General Configuration 2.Select Software Component Implementations 3.Select BSW Module Implementations 4.Each Runnable needs to be assigned to an Operating System Task in order to be invoked. 5.Map BSW Executables to tasks 6.Resolve Exclusive Areas 7.Select Implicit Communication behavior 8.Select Calibration Support 9.Configure Non Volatile Memory Block Component (only needed if decisions on the configuration have to be taken during ECU Configuration) 10.Select the supported post-build variants		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	

Relation Type	*Related Element*	*Mul.*	*Note*
Consumes	BSW Module Vendor-Specific Configuration Parameter Definition	1	The definitions for the module RTE
Consumes	ECU Extract	1	Elements of the System Description and VFB Description are referred by the RTE configuration.
Consumes	Delivered Atomic Software Components	1..*	Required input: • References to all component implementation descriptions on this ECU • SwcInternalBehavior (for example to map the runnables to tasks) which was used in the contract phase of the software components on this ECU
Consumes	ECU Timing	0..1	
Consumes	BSW Module Delivered Bundle	0..*	Input from the BSW Module Description is needed related to Scheduling, Exclusive Areas, Triggers and Modes.
Consumes	Service Component Description	0..*	The Internal Behavior of Service Components contributes to the RTE configuration.
ParameterInOut	ECU Configuration Values	1	

Table 3.210: Configure RTE

3.6.1.8 Configure Watchdog Manager

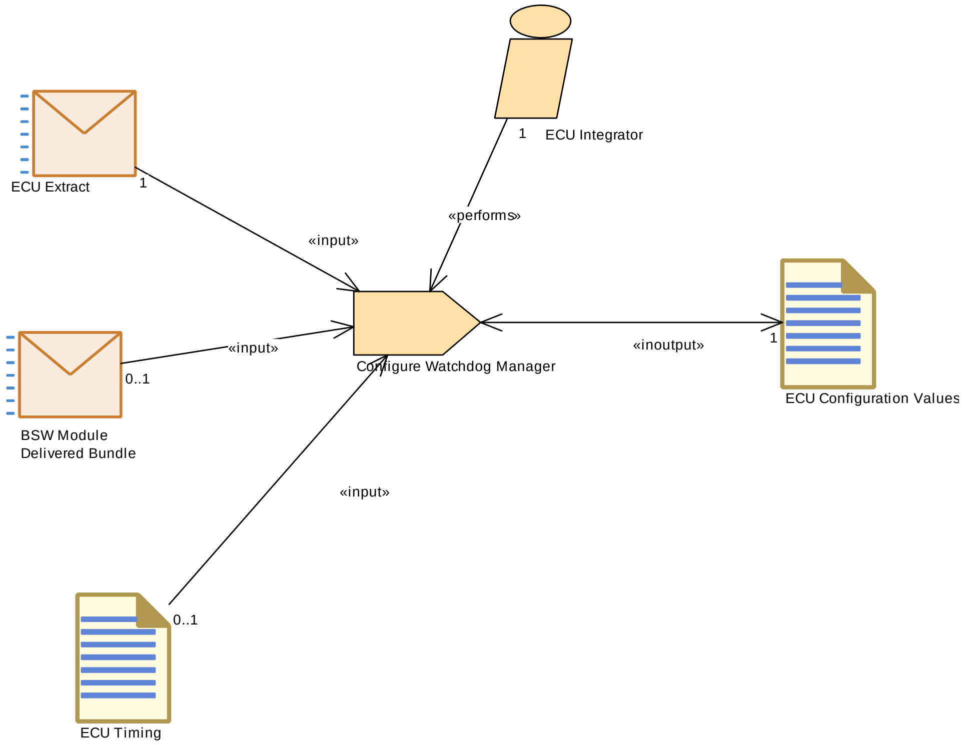

Figure 3.103: Configure Watchdog Manager

Task Definition	**Configure Watchdog Manager**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Describes the steps required to succesfully configure the Watchdog Manager		
Description	Configured Top-Down. Service needs determine what kind of watchdog manager you need. For each service need there is one interface. You can connect several of these interfaces to one watchdog manager		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	Application software requirements for WdgM, especially SwcServiceDependency and ServiceNeeds.
Consumes	BSW Module Delivered Bundle	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
Consumes	ECU Timing	0..1	
ParameterInOut	ECU Configuration Values	1	

Table 3.211: Configure Watchdog Manager

3.6.1.9 Configure Mode Management

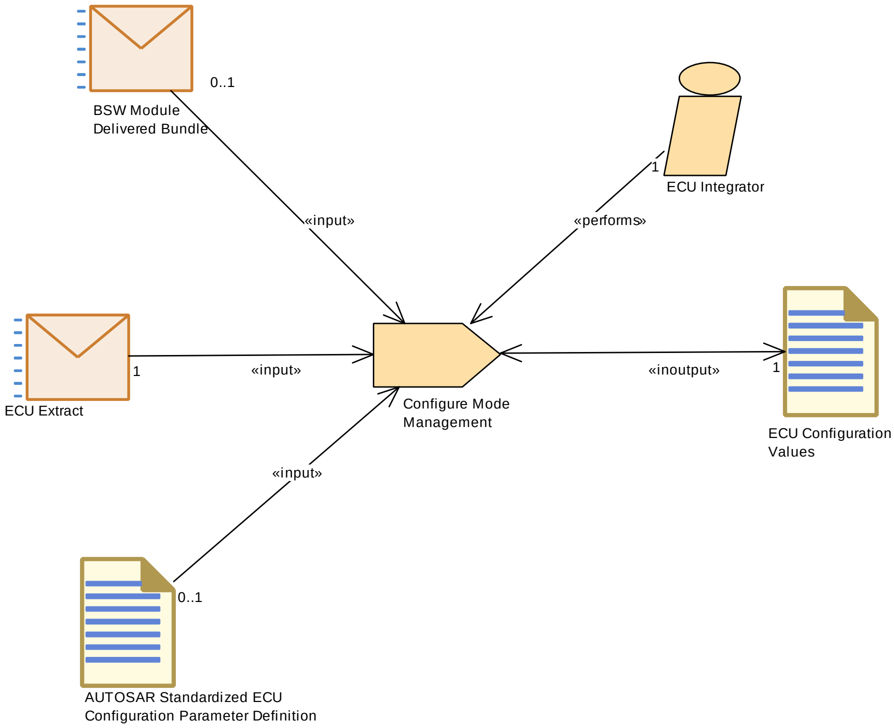

Figure 3.104: Configure Mode Management

Task Definition	**Configure Mode Management**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Configure the Mode Managers in the Basic Software for this ECU.		
Description	Configure the Mode Managers in the Basic Software for this ECU. In the methodology library this is modeled as a single task (for simplicity) though in practice it may consist of several single tasks.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	Application software requirements for NvM, especially SwcServiceDependency and ServiceNeeds.
Consumes	AUTOSAR Standardized ECU Configuration Parameter Definition	0..1	
Consumes	BSW Module Delivered Bundle	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ParameterInOut	ECU Configuration Values	1	

Table 3.212: Configure Mode Management

3.6.1.10 Configure NvM

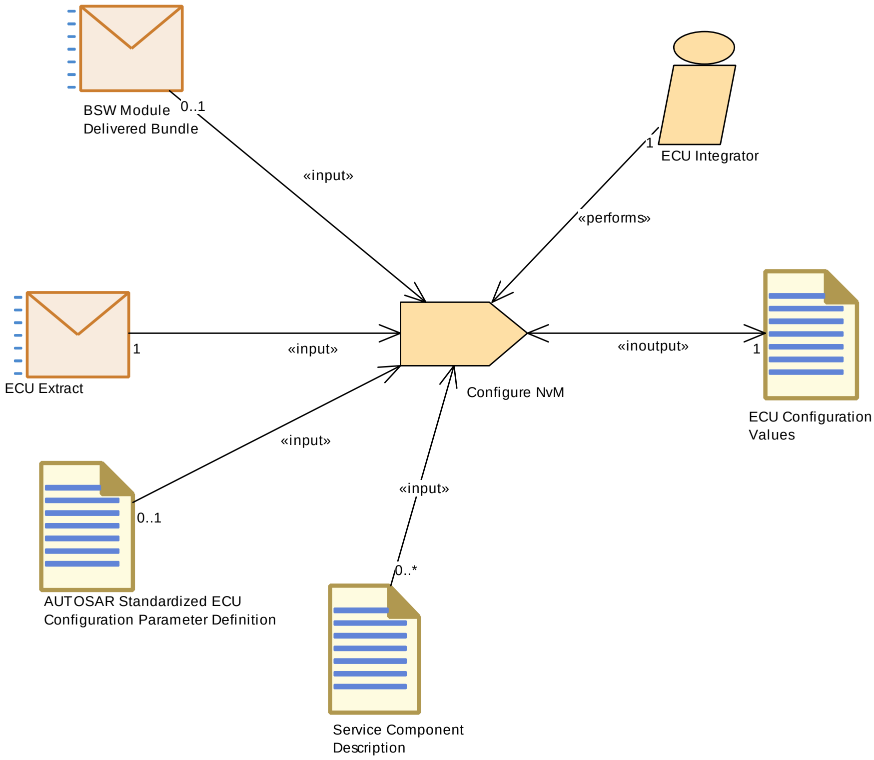

Figure 3.105: Configure NvM

Task Definition	**Configure NvM**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Configure the NvM stack for this ECU.		
Description	Configure the NvM stack for this ECU. In the methodology library this is modeled as a single task (for simplicity) though in practice it may consist of several single tasks. Requirements for the configuration of NvM can be collected • from the upstream information about ServiceDependencies and ServiceNeeds in the ECU Extract and BSW Modules • from existing ECU configuration values • from Service Component Descriptions created for other Services (e.g. DEM)		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	Application software requirements for NvM, especially SwcServiceDependency and ServiceNeeds.
Consumes	AUTOSAR Standardized ECU Configuration Parameter Definition	0..1	

Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	BSW Module Delivered Bundle	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
Consumes	Service Component Description	0..*	The configuration of diagnostics, especially of the DEM, typically leads to the definition of additional data to be stored in NvM. One possibility to handle this is to create ServiceNeeds on the level ServiceComponentType which is then taken into account for the configuration of the NvM.
ParameterInOut	ECU Configuration Values	1	

Table 3.213: Configure NvM

3.6.1.11 Configure Diagnostics

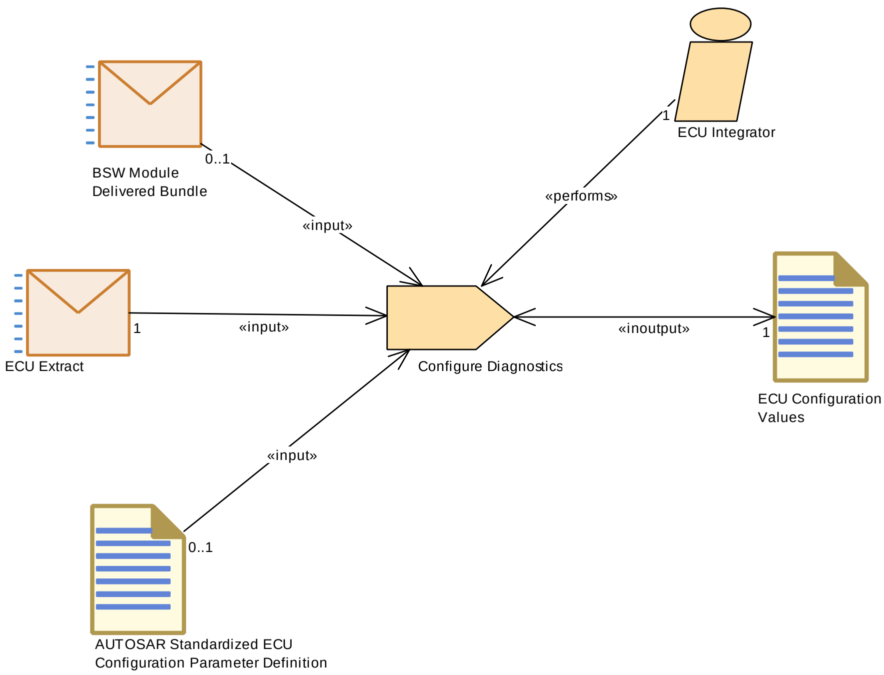

Figure 3.106: Configure Diagnostics

Task Definition	Configure Diagnostics		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Configure the diagnostic modules for this ECU		
Description	Configure the diagnostic modules for this ECU. In the methodology library this is modeled as a single task (for simplicity) though in practice it may consist of several single tasks. Diagnosis is used as an example here.		
Relation Type	**Related Element**	**Mul.**	**Note**
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	Application software requirements for diagnostics, especially SwcServiceDependency and ServiceNeeds.
Consumes	AUTOSAR Standardized ECU Configuration Parameter Definition	0..1	
Consumes	BSW Module Delivered Bundle	0..1	Predefined or recommended configuration values, vendor specific parameters, ServiceNeeds defined by BSW.
ParameterInOut	ECU Configuration Values	1	Configuration Values for DEM, DCM, DLT, FIM.

Task Definition	**Create Service Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Create an instances for all required Service Components, configure them, create necessary ports and connectors to the respective application software components. This completes the ECU Software Composition.		
Description	The ECU Extract contains all information about which components are mapped to a specific ECU. In a new "flat" Software Composition (meta-class RootSwCompositionPrototype) all other compositions have been removed. This has to be extended by an aggregation of the SwComponentPrototypes which describe the Services required by all application components on the ECU: • For each mapped SwComponentPrototype of type AtomicSwComponentType, the PortPrototypes requiring a particular Service and the asscociated SwcServiceDependency-s and ServiceNeeds are collected. Based on this information, a ServiceSwComponentType and its prototype is created exactly once per service with the corresponding number of PortPrototypes, thus that all service-type PortPrototypes of the Application Components have their PortPrototype counterpart on the ServiceSwComponentType. • RTE generation requires that an InternalBehavior and Implementation is created for each ServiceSwComponentType. In particular, the port defined argument values required for the usage of some service interfaces are configured, and the required RunnableEntities and RTEEvents are set up. It is also required to define a mapping between elements of the generated SWC and existing or generated elements of the BSW module description. • The evaluation of the input might result in further ServiceNeeds to be added to the generated InternalBehavior - for example a ServiceSwComponentType created for the DEM might include ServiceNeeds for NVRAM blocks. It is assumed, that such interdependencies are incrementally resolved within this task for all involved Service Components such that the outputs are consistent. Note that this is just one possibility to handle the situation - another option is to resolve the interdependencies only within the ECU configuration tasks (Configure Diagnostics, Configure NvM) without creating additional ServiceNeeds. Depending on the details of the configuration process for the particular module (namely which parts are generated or manually created), the steps described above can be done before, in parallel or after setting up the ECU configuration of the involved BSW modules. Likewise, the information used to create the ServiceSwComponentType(s) can come directly as input from the ECU Extract, or via the ECU Configuration. Therefore both artifacts are shown as optional input. The ECU Configuration is also an output, because a reference to the created SwComponentPrototype(s) must be entered here. The creation of connectors between the service and application components is a separate task..		
Relation Type	***Related Element***	***Mul.***	***Note***

Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	BSW Module Delivered Bundle	0..1	Required in order to define a mapping between SWC and BSW.
Consumes	ECU Configuration Values	0..1	The creation of Service Component details may depend on ECU configuration values, especially for the DCM.
Consumes	ECU Extract	0..1	Input information about the Service Ports and Service Dependencies of the software components.
Consumes	ECU Timing	0..1	Additional information for fine tuning configuration decisions.
Produces	Atomic Software Component Implementation	1	In order to generate the RTE, one needs to create a kind of dummy Implementation element for the Service Component, however this should not be filled with descriptive elements, e.g. resource consumption, as these are already defined by the Basic Software Module Implementation Description.
Produces	ECU Configuration Values	1	Enter links to the created SwComponentPrototypes.
Produces	Service Component Description	1	
Produces	Software Component to BSW Mapping	0..1	

Table 3.215: Create Service Component

3.6.1.13 Connect Service Component

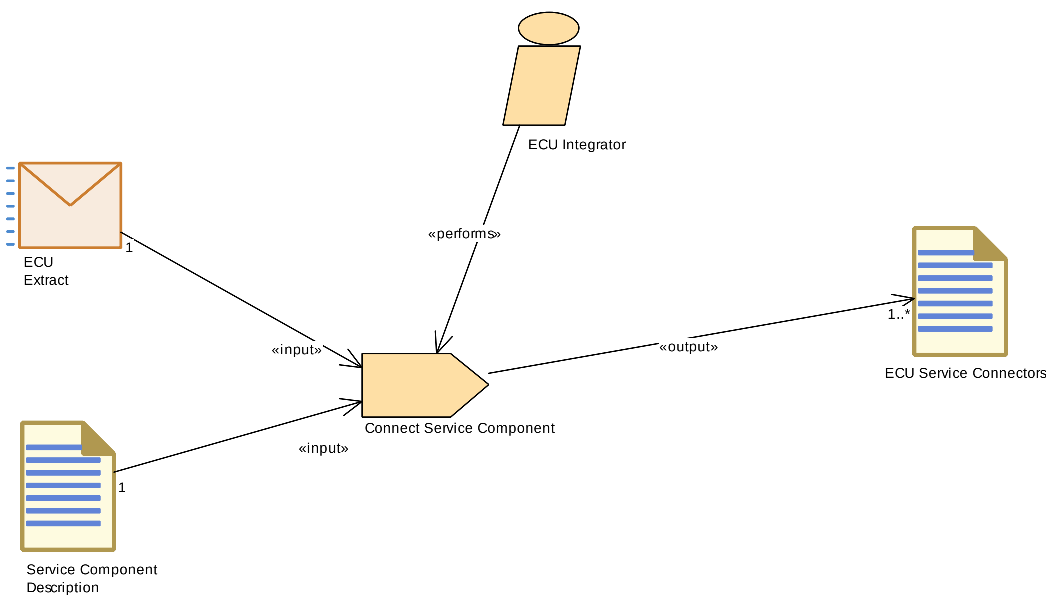

Figure 3.108: Connect Service Component

Task Definition	**Connect Service Component**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description			
Description	In order to connect the "isService"-ports of the application components to a particular ServiceSwComponentType, AssemblyConnectorPrototypes are generated. The ECU Extract with its RootSwCompositionPrototype, extended by the Service Components and their connectors, finally serves as input for generating the RTE.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Extract	1	Find the ports on the application side to be connected to the Service Component.
Consumes	Service Component Description	1	Required in order to define the connector links to the ports on the BSW side.
Produces	ECU Service Connectors	1..*

3.6.1.14 Configure COM

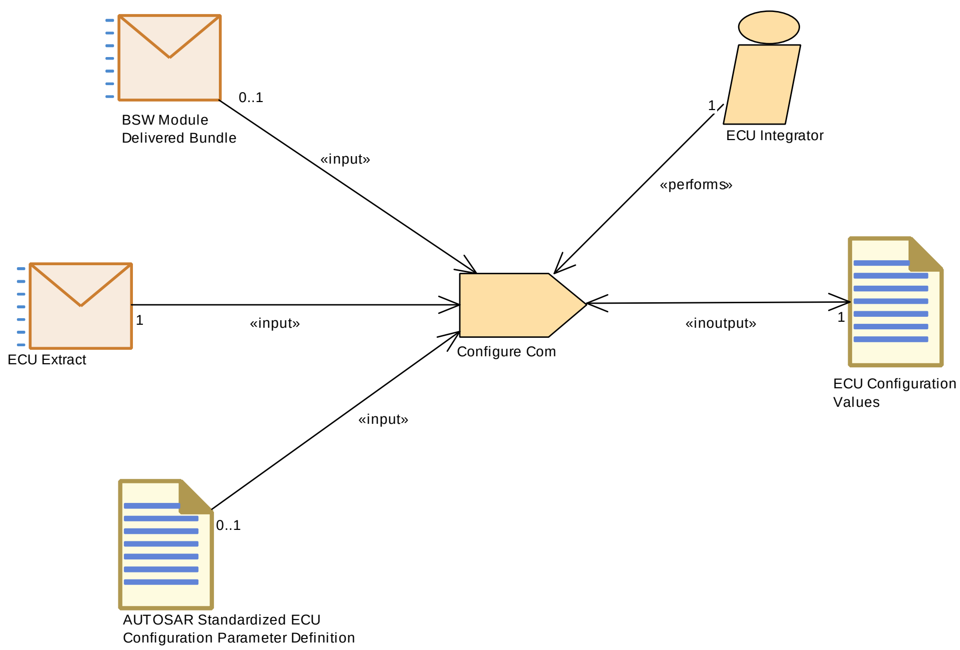

Figure 3.109: Configure COM

Task Definition	Configure Com		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Configure the COM stack modules within an ECU		
Description	The ECU Extract of the System Configuration contains the major part of information that is needed to configure the COM Stack modules (COM, PduR, CanIf, FrIf, LinIf, CanDrv, Fr, Lin, IPduM, TP, NM). Many parameter values of the ECU configuration can be derived from the ECU extract.The missing ECU specific configuration parameters that can not be derived from the System Description need to be set in this phase, e.g. Vendor-Specific Configuration Parameters. The following steps will be needed to perform the task : 1- Derive configuration parameter values from ECU extract : The System Template Specification describes rules on how the individual ECU configuration parameters shall be derived from the Upstream Templates (SWC Template, System Template, ECU Resource Template). This rules shall be followed. 2- Derive global PDUs from ECU extract : A global PDU has to be configured for each I-PDU flow and is added to the PDU collection of the module EcuC. Derived from the ECU Extract all PDUs that traverse through the COM Stack have to be created. 3- Create PDU References from the BSW Module PDUs to the global PDUs in the module EcuC:As soon as these global PDUs are created the references from the local module PDUs to the appropriate global PDUs need to be configured. 4-Set Missing and Vendor-Specific Parameter Values:Missing and Vendor-Specific Parameter Values need to be set 5-Set BSW Module specific PDU handle IDs:The last step is the assignment of the actual values for the Handle IDs. This can be achieved by an automatic tool which might be run directly before the generation of the module.

3.6.1.17 Configure Debug

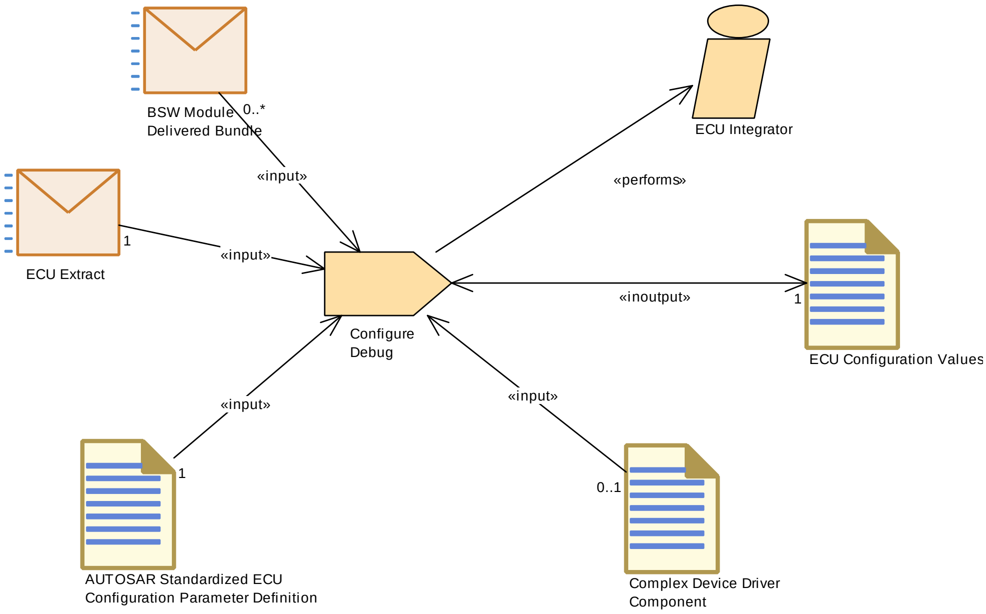

Figure 3.112: Configure Debug

<table>
<tr><td>Task Definition</td><td colspan="3">Configure Debug</td></tr>
<tr><td>Package</td><td colspan="3">AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks</td></tr>
<tr><td>Brief Description</td><td colspan="3">Configure the AUTOSARdebugger Module</td></tr>
<tr><td>Description</td><td colspan="3">The AUTOSAR Debugger Module (Dbg) handles the interaction between the Debugger Host and the AUTOSAR ECU. It is split into the "core" and the "communication" part. Each BSW has an ID & Each API has an ID. (e.g. module 84, api 5). The Debugger Host (shortly called Host) may be connected via

1. Existing communication buses which are also used for the functional behavior of the ECU.

2. A dedicated debugging line which is not used for functional behavior of the ECU. (e.g. via complex device driver)

Since Dbg needs information on the debugged software, tDbg is configured quite late in the ECU Configuration steps. Other modules must be configured before the debug. Even after changes of the OS configuration, Dbg needs to be updated as well.

The input to the Dbg ECU Configuration are: 1. ECU Configuration Values description
• If existing communication buses are used, Dbg needs to transmit and receive I-Pdus which then are handled in the COM-Stack. Those I-Pdus need to be created / referenced.
• Usage of OsAlarm
• Usage of GptChannel (optional, for time stamping)

2. BSW Module Descriptions of the debugged modules in order to identify which variables / functions can be debugged. Prerequisites are: The variables need to be placed in global accessible memory; the data types of these variables need to be defined in the header files.</td></tr>
<tr><td>Relation Type</td><td>Related Element</td><td>Mul.</td><td>Note</td></tr>

<tr><td>Consumes</td><td>BSW Module Delivered Bundle</td><td>0..*</td><td></td></tr>
<tr><td>ParameterInOut</td><td>ECU Configuration Values</td><td>1</td><td></td></tr>
</table>

Table 3.220: Configure Debug

The task to configure the debug module consists of the following detailed steps (not shown in the table above due to formating reasons):

1. RTE VFB-Tracing if needed : The `RTE ECU Configuration` shall contain a "`RteVfbTraceClientPrefix = Dbg`".

2. Periodic Data Collection if needed : Configure the reference to the `OsAlarm` which will invoke the periodic data collection. Note that the `OsAlarm` needs to be configured in the `Os ECU Configuration` (before or after).

3. Timestamp Measurement if needed : Configure the size of the timestamp (16 or 32 bit) then configure the reference to the GptChannel which will provide the timestamp information. Note that the GptChannel needs to be configured in the Gpt ECU Configuration (before or after).

4. Configure the Buffering of the Debug : Size, Strategy (last-is-best/queued) and behavior.

5. AUTOSAR Communication stack : Configure the used Tx and Rx I-Pdus, the corresponding I-Pdus need to be configured in the EcuC Module and the rest of the COM-Stack. If complex driver is used for communication, configure complex driver.

6. Configure the to be debugged elements - BSW only - Prerequisite: The BSW Module shall be already configured and generated therefore there is an updated BSW-Module Description available of the actually generated BSW Module.The first work will be to get the list of traceable API calls out of the BSWMD of the BSW Module. Then select which API calls shall be traced (e.g. call "CanIf_Transmit" from the "PduR" to the "CanIf") and configure each trace function: buffering, timestamp.

7. Configure the to be debugged elements - RTE only - Prerequisite: The RTE has been generated, therefore there is an updated BSW-Module Description available of the actually generated RTE. Attention: The RTE shall not be re-configured after the Dbg has been configured, otherwise the Dbg needs to be re-configured as well. The first work will be get the list of available VFB-Trace functions out of the BSWMD of the RTE. Then, Select which VFB-Trace functions shall be traced (e.g. Rte_Dbg_Runnable_component_re_Start()), configure each VFB-Trace function: Buffering,Timestamp, in case of Rte-Com tracing: which Com-Signal is traced, in case of VFB-Signal tracing: which VariablePrototype is traced, in case of Client-Server tracing: which OperationPrototype is traced, in case of RunnableEntity tracing: which RunnableEntity is traced.

8. Configure the to be debugged elements - BSW and RTE - Prerequisite: The RTE has been generated, therefore there is an updated BSW-Module Description available . Attention: The RTE shall not be re-configured after the Dbg has been configured.The first step will be out of the BSWMD of the BSW and the RTE to extract the list of available debuggable variables and provide it to the Dbg configuration. Then, select which variables shall be debugged (e.g. internal states of the module), configure each individual DID with symbol name, optional size, optional absolute address, buffering, timestamp, collection frequency Note: Size and address (e.g. for an ECU register) could be resolved by the linker, hence optional here.

9. Generate the Dbg Module: Generate the c and header files of the Dbg, use the additional header files of the to be debugged modules in order to perform a "sizeof()"

operation in the compiler, compile Dbg Module (and other to-be-debugged modules), analyze the object file in order to update the ECU Configuration Values description which additional information the length information for each DID (out of the sizeof() operation). Host application uses this information (ECU configuration of debug module, BSW module description of the debug module and the to-be-debugged modules) in order to send the correct DIDs.

3.6.1.18 Generate BSW Configuration Code and Model Extensions

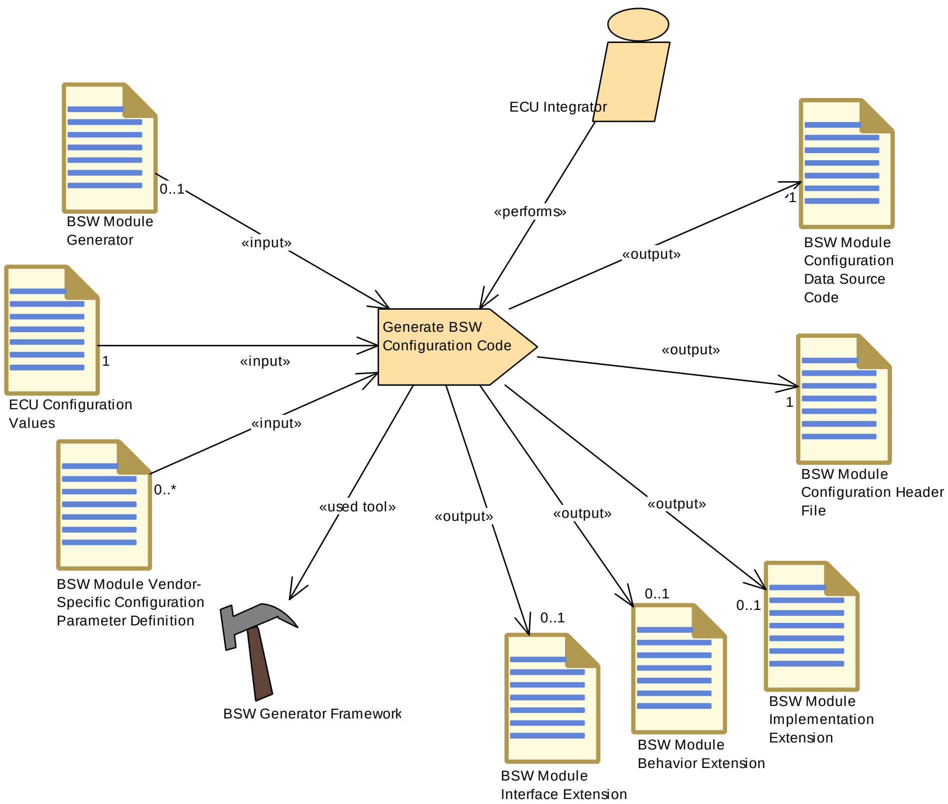

Figure 3.113: Generate BSW Code and model extensions

Task Definition	Generate BSW Configuration Code		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate source code which implements configuration data for link- or compile-time configuration.		
Description	A generator reads the relevant parameters from the ECU Configuration Description and creates a separate code file that implements the specified configuration. This task is used for link-time configuration, i.e. the configuration code can be produced at link-time of the core code or for compile-time configuration, if the configuration code cannot be put into a header file (e.g. for tables), even if the core code and the configuration code shall be compiled at the same time. A header file may be produced in addition, to declare the data. Furthermore the generator may produce extensions of the BSW module description artifacts as a result of configuration parameter values which are set at integration time.

3.6.1.25 Generate ECU Executable

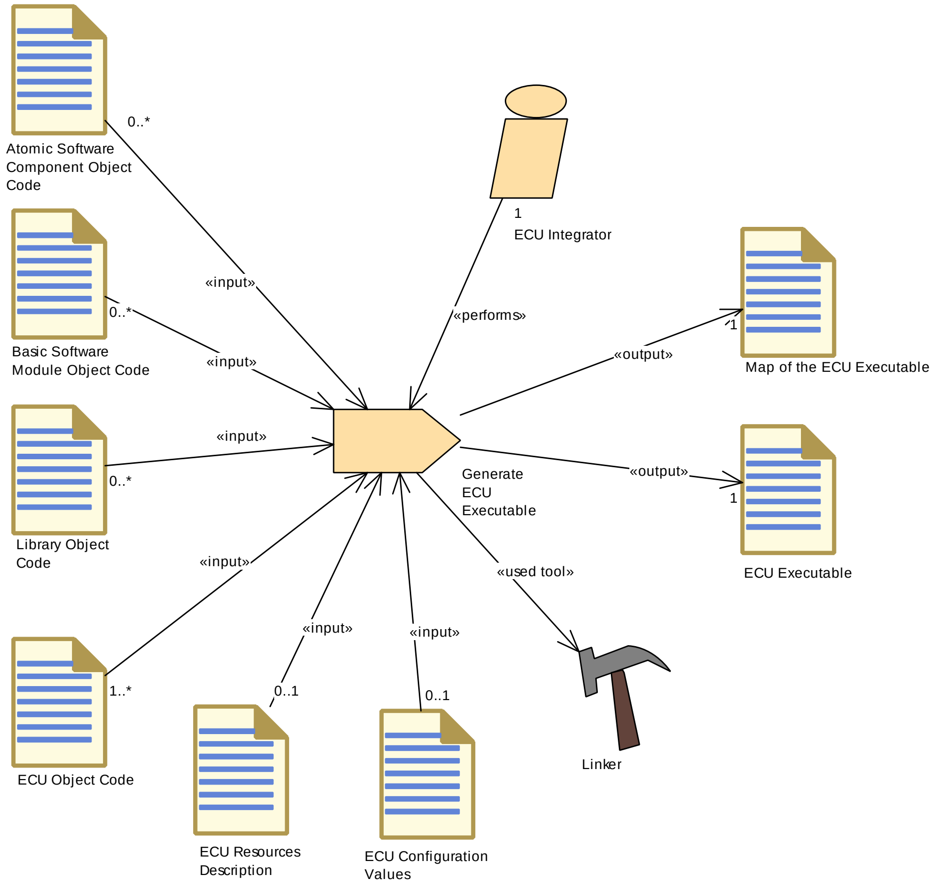

Figure 3.119: Generate ECU Executable

Task Definition	**Generate ECU Executable**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Generate the executable code of the ECU out of the object files and linker configuration.		
Description	The steps to generate the code for an ECU resemble today's development practice. However, it is important to note that this activity is more than a simple linker step. Information from the ECU Configuration Description might be used to generate specially configured executable software. The ECU Configuration Description is needed as input to the Generate Executable activity, because it contains the information which BSW modules and SWC implementations are used to create the executable and further information about the memory mapping. The output of this activity is the ECU Executable and the Map of Executable (which is typically the log file from linking the ECU Executable). The detailed input and output formats of this task are not standardized by AUTOSAR, therefore this task is only included for informative purposes. Note that ECU Configuration is shown as an input to get the overall picture, however in practice more specific artifacts (e.g. linker settings, make file etc.) will have to be generated out of the ECU configuration before the actual software build can be started. Especially, the information about the mapping of the physical memory sections to the memory section used in the software, which is described in the so-called EcuC parameter values, is needed in order to generate the linker settings.

3.6.1.27 Generate A2L

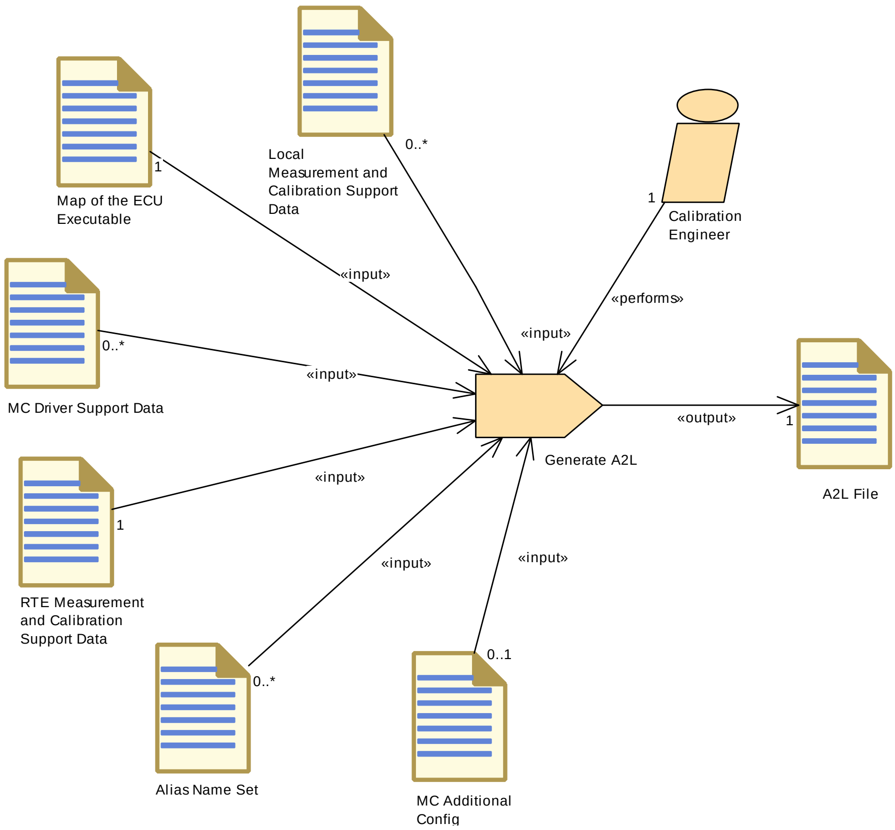

Figure 3.121: Generate A2L

Task Definition	**Generate A2L**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Tasks		
Brief Description	Generate the A2L File for an ECU.		
Description	The A2L File created by this task is the final representation of the data given by RTE Measurement and Calibration Support Data and Local Measurement and Calibration Support Data. The main purpose of this task is to replace all symbolic information on data location found in these input data by actual addresses. Optionally, it replaces identifiers by alias names given in Alias Name Set(s). Finally is completes the A2L file with configuration from ECU driver software (MC Driver Support Data) and configuration not determined by AUTOSAR artifacts (MC Additional Configuration). This task is not part of AUTOSAR, it is only included for completeness of the use cases. The Map of the ECU Executable (linker map file) is shown as input in order to illustrate the principle use case only. Note that one needs additional information, like the .ELF or .COFF file, to resolve addresses of elements of composite C-variables.

Brief Description	All the work products that form the deliverable of an AUTOSAR ECU.		
Description	All the work products that form the deliverable of an AUTOSAR ECU software build. ECU in this context means processor, so if an electronic control unit consists of several processors, one "ECU Software Delivered" will be needed for each processor. Note that the detailed format for all parts of this deliverable is not defined by AUTOSAR.		
Kind	Delivered		
Relation Type	***Related Element***	***Mul.***	***Note***
Aggregates	ECU Executable	1..*	
Aggregates	A2L File	0..*	

Relation Type	Related Element	Mul.	Note
Aggregates	BSW Module Configuration Data Loadable to ECU Memory	0..*	
ProducedBy	Integrate Software for ECU	1	

Table 3.233: ECU Software Delivered

3.6.2.3 Service Component Description

Artifact	**Service Component Description**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Describes the RTE relevant part of an AUTOSAR Service on a given ECU in form of a ServcieComponentType with all its ports and an internal behavior.		
Description	Describes the RTE relevant part of an AUTOSAR Service on a given ECU in form of a ServiceComponentType with all its ports and an internal behavior. This artifact must be generated during the ECU configuration process, latest before the RTE is generated. It depends on the needs of the software components for this AUTOSAR Service.		
Kind	AUTOSAR XML		
Relation Type	**Related Element**	**Mul.**	**Note**
ProducedBy	Create Service Component	1	
ConsumedBy	Connect Service Component	1	Required in order to define the connector links to the ports on the BSW side.
ConsumedBy	Configure NvM	0..*	The configuration of diagnostics, especially of the DEM, typically leads to the definition of additional data to be stored in NvM. One possibility to handle this is to create ServiceNeeds on the level ServiceComponentType which is then taken into account for the configuration of the NvM.
ConsumedBy	Configure RTE	0..*	The Internal Behavior of Service Components contributes to the RTE configuration.
ConsumedBy	Generate RTE	0..*	
ConsumedBy	Generate RTE Postbuild Dataset	0..*	
ConsumedBy	Generate RTE Prebuild Dataset	0..*	
atpUseMetaModelElement	ServiceSwComponentType	1	
atpUseMetaModelElement	SwcInternalBehavior	1	

Relation Type	***Related Element***	***Mul.***	***Note***

Table 3.234: Service Component Description

3.6.2.4 ECU Service Connectors

Artifact	**ECU Service Connectors**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	The conectors to the Service Components which complete the complete Software Composition predefined in the ECU extract.		
Description	The assembly connectors to the Service Components which complete the Software Composition predefined in the ECU extract. These connectores are added during ECU integration as a separate artifact to the already defined composition of atomic software components.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Connect Service Component	1..*	
ConsumedBy	Define ECU Timing	1..*	
ConsumedBy	Generate RTE	0..*	
atpUseMetaModelElement	AssemblySw Connector	1	

Table 3.235: ECU Service Connectors

3.6.2.5 ECU Timing

Artifact	**ECU Timing**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	TimingDescription and TimingConstraints for a concrete ECU		
Description	TimingDescription and TimingConstraints defined for a concrete ECU taking the ECU configuration and the ECU Software Composition (including their implementation) into account.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Define ECU Timing	1	
ConsumedBy	Configure OS	0..1	
ConsumedBy	Configure RTE	0..1	
ConsumedBy	Configure Watchdog Manager	0..1	
ConsumedBy	Create Service Component	0..1	Additional information for fine tuning configuration decisions.
atpUseMetaModelElement	EcuTiming	1	

Table 3.236: ECU Timing

3.6.2.6 BSW Module Interface Extension

Artifact	**BSW Module Interface Extension**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description			
Description	Additions to the BSW Module on the interface level during integration. It is used for example to add Basic Software Module Entries in response to the ECU configuration, for example callback declarations.		
Kind	AUTOSAR XML		
Relation Type	**Related Element**	**Mul.**	**Note**
AggregatedBy	BSW Module Integration Bundle	0..*	
ProducedBy	Generate BSW Configuration Code	0..1	
atpUseMetaModelElement	BswModuleDescription	1	
atpUseMetaModelElement	BswModuleEntry	1	

Table 3.237: BSW Module Interface Extension

3.6.2.7 BSW Module Behavior Extension

Artifact	**BSW Module Behavior Extension**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description			
Description	Additions to the BSW Module on the behavior level during integration. It can for example be used to add local data declaration (constantMemory, staticMemory, perInstanceMemory) for debug or calibration purposes in response to configuration parameters.		
Kind	AUTOSAR XML		
Relation Type	**Related Element**	**Mul.**	**Note**
AggregatedBy	BSW Module Integration Bundle	0..*	
ProducedBy	Generate BSW Configuration Code	0..1	
ConsumedBy	Generate Local MC Data Support	0..1	
atpUseMetaModelElement	BswInternalBehavior	1	

Table 3.238: BSW Module Behavior Extension

3.6.2.8 BSW Module Implementation Extension

Artifact	**BSW Module Implementation Extension**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description			
Description	Additions to the BSW Module on the implementation level during integration. It is used for example to add information on resource consumption.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	BSW Module Integration Bundle	0..*	
ProducedBy	Generate BSW Configuration Code	0..1	
ProducedBy	Measure Resources	0..*

Table 3.239: BSW Module Implementation Extension

3.6.2.9 ECU Configuration Values

Artifact	**ECU Configuration Values**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	The collection of all configuration values for an ECU.		
Description	First of all, the ECU Configuration Values contain a link to the System element which comes with the ECU Extract thus it can be used as a root element for integration on this ECU. Furtheron, it contains a collection of all configuration values for an ECU, which is gradually filled. Starting with the root element EcucValueCollection it contains the actual configuration settings EcucModuleConfigurationValues for each module including the RTE. Note that due to their strong interrelation, these parts are not considered as separate artifacts in the use cases for ECU integration. A special set of configuration values is the so-called EcuC-configuration: It contains the configuration values which are relevant for the whole ECU. Tools that interpret the configuration values need to know the underlying parameter definition. Therefore, in addition to the configuration values, each EcucValueCollection contains a link and the version of the parameter definition to which it adheres. This parameter definition is either part of the AUTOSAR Standardized ECU Configuration Parameter Definition or, in case of vendor specific extensions, is given by the artifact Basic Software Module Vendor-Specific Configuration Parameter Definition.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***

Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Configure Memmap Allocation	1	MemMapAllocation
ProducedBy	Create Service Component	1	Enter links to the created SwComponentPrototypes.
ProducedBy	Generate Base Ecu Configuration	1	
ProducedBy	Generate RTE	0..1	Optional output for the configuration of the OS.
ParameterInOut	Configure Com	1	
ParameterInOut	Configure Debug	1	
ParameterInOut	Configure Diagnostics	1	Configuration Values for DEM, DCM, DLT, FIM.
ParameterInOut	Configure ECUC	1	
ParameterInOut	Configure IO Hardware abstraction	1	
ParameterInOut	Configure MCAL	1	
ParameterInOut	Configure Mode Management	1	
ParameterInOut	Configure NvM	1

ParameterInOut	Configure Watchdog Manager	1	
ConsumedBy	Define ECU Timing	1	
ConsumedBy	Generate BS W Configuration Code	1	
ConsumedBy	Generate BSW Configuration Data Loadable	1	
ConsumedBy	Generate BSW Memory Mapping Header	1	MemMapAllocation: Mapping of the abstract sections (SwAddressMethods for generic mapping resp. MemorySection Elements for specific mapping) to the compiler specific MemMapAddressingModes.
ConsumedBy	Generate BSW Postbuild Configuration Code	1	
ConsumedBy	Generate BSW Precompile Configuration Header	1	
ConsumedBy	Generate BSW Source Code	1	
ConsumedBy	Generate OS	1	
ConsumedBy	Generate RTE	1	

Relation Type	*Related Element*	*Mul.*	*Note*
ConsumedBy	Generate RTE Postbuild Dataset	1	
ConsumedBy	Generate RTE Prebuild Dataset	1	find the Predefiined Variant to be used
ConsumedBy	Generate SWC Memory Mapping Header	1	MemMapAllocation: Mapipng of the abstract sections (SwAddressMethods for generic mapping resp. MemorySection Elements for specific mapping) to the compiler specific MemMapAddressingModes.
ConsumedBy	Generate Scheduler	1	Configuration values for the BSW Scheduler (subset of RTE configuration).
ConsumedBy	Create Service Component	0..1	The creation of Service Component details may depend on ECU configuration values, especially for the DCM.
ConsumedBy	Generate BSW Memory Mapping Header	0..1	List of used BSW modules (EcucValueCollection.ecucValue.moduleDescription)
ConsumedBy	Generate ECU Executable	0..1	may be used to set up build environment
ConsumedBy	Generate SWC Memory Mapping Header	0..1	Existence of SWCs could be identified by usage of the RTE ECU Configuration "RteSwComponentType.RteImplementationRef"
atpUseMetaModelElement	EcucModuleConfigurationValues	1	
atpUseMetaModelElement	EcucValueCollection	1	

Table 3.240: ECU Configuration Values

3.6.2.10 RTE Implementation Description

Artifact	**RTE Implementation Description**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Implementation Description for the RTE, generated by the RTE generator.		
Description	Implementation Description for the RTE, generated by the RTE generator. Uses the format of BswImplementation. This artifact is required to provide information for other generators and the build process, namely debugging information, memory section. It aggregates also the support data for measurement and calibration, which is considered as a separate artifact.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Generate RTE	1	

Relation Type	*Related Element*	*Mul.*	*Note*
ProducedBy	Generate Scheduler	0..1	Creates a subset of the RTE implementation description that contains only the description of data owned by the BSW Scheduler.
atpUseMetaModelElement	BswImplementation	1	

Table 3.241: RTE Implementation Description

3.6.2.11 RTE Prebuild Configuration Header

Artifact	**RTE Prebuild Configuration Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	RTE Prebuild Configuration Header File. It defines all variants for the RTE code which have to be bound later than code generation time but before build time.		
Description	RTE Prebuild Configuration Header File. It defines the setting of all variants for the RTE code (via macro code) which have to be bound later than code generation time but before build time.		
Kind	Code		
Relation Type	*Related Element*	*Mul.*	*Note*
ProducedBy	Generate RTE Prebuild Dataset	1	
ConsumedBy	Compile ECU Source Code	0..1

<table>
<tr><th>Artifact</th><th colspan="3">Calibration Parameter Value Set</th></tr>
<tr><td>Package</td><td colspan="3">AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products</td></tr>
<tr><td>Brief Description</td><td colspan="3">Calibration Parameter Value Setting</td></tr>
<tr><td>Description</td><td colspan="3">A set of calibration parameter values used to initialize the memory objects which implement calibration parameters. The values are specific for the software component instances in ECU scope. They will override any initial values defined for those parameters within the ECU Extract. The parameter values can be defined as ApplicationDataTypes or as ImplementationDataTypes which has several use cases. These two use cases are supported by the RTE generation phase:
• Parameter values defined as ImplementationDataTypes can be used as instance specific initialization for calibration parameters within components as soon as the respective ImplementationDataTypes are available (which must be the case for RTE generation anyhow).
• Parameter values defined as ApplicationDataTypes can be used as instance specific initialization for calibration parameters which are only defined with ApplicationDataTypes.

The next case is not modelled within AUTOSAR in detail:
• Parameter values defined as ApplicationDataTypes can be used to exchange initial values with the component vendor not publishing the transformation algorithm between ApplicationDataTypes and ImplementationDataTypes</td></tr>

3.6.2.13 Local Measurement and Calibration Support Data

Artifact	**Local Measurement and Calibration Support Data**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Generated artifact, which supports the later generation of "A2L"-files for measurement and calibration data which are owned locally by a component or module.		
Description	Generated artifact which is used as an input for the later generation of "A2L"-files for measurement and calibration. It relates the measurment and calibration data listed in the ECU FlatMap to the C-variables used locally within a component or module (this is relevant only valid for those parameters and variables, which are not implemented by the RTE) . In addition, it contains all configuration data which are relevant for the A2L generator (e.g. the access method to calibration data whithin a complex driver). This XML-artifact is linked via a (splitable) aggregation to the Implementation Description of the component or module, but it is considered as a separate artifact.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
AggregatedBy	BSW Module Integration Bundle	0..*	
ProducedBy	Generate Local M C Data Support	1	
ConsumedBy	Generate A2L	0..*	
atpUseMetaModelElement	McSupportData	1	

Table 3.244: Local Measurement and Calibration Support Data

3.6.2.14 RTE Measurement and Calibration Support Data

Artifact	**RTE Measurement and Calibration Support Data**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	RTE generator output, which supports the later generation of "A2L"-files for the measurement and calibration data which are owned by the RTE.		
Description	RTE generator output, which is used as an input for the later generation of "A2L"-files for measurement and calibration. It relates the measurement and calibration data listed in the ECU FlatMap to the C-variables of the generated RTE code. For all these data it contains copies of the attributes which are relevant for A2L generation. In additions it contains all configuration data which are relevant for the A2L generator (namely the access method to calibration data which is supported by the RTE). This XML-artifact is linked via a (splitable) aggregation to the RTE Implementation Description, but is considered as a separate artifact. The most important attributes for each data instance are: • Its shortName copied from the ECU Flat Map to be used as identifier and for display by the MC system. • The category copied from the corresponding data type (ApplicationDataType if defined, otherwise ImplementationDataType) as far as applicable. • The symbol used in the programing language. It will be used to find out the actual memory address by the final generation tool with the help of linker generated information. • All aggregated and referred elements like CompuMethod or BaseType describing the data (with the exception of the Flat Map) are completely copied from "upstream" information. Therefore this artifact is a self-contained description which can be forwarded to the A2L generator without needing related descriptions.		
Kind	AUTOSAR XML		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Generate RTE	0..1	
ProducedBy	Generate Scheduler	0..1	Creates a subset of the measurement & calibration support data related only to the data owned by the BSW Scheduler.
ConsumedBy	Generate A2L	1	
atpUseMetaModelElement	McSupportData	1	

Table 3.245: RTE Measurement and Calibration Support Data

3.6.2.15 RTE Source Code

Artifact	**RTE Source Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Source code implementiing the RTE on a CPU.		
Description	Source code implementing the RTE on a CPU. The output of an RTE generator can consist of both generated code and configuration for library code that may be supplied as either object code or source code. Both configured and generated code reference standard definitions that are defined in one of two standardized header files: The RTE Header File and the Lifecycle Header File. These header files are not explicitly shown in the methodology, as in all tasks they appear with the RTE source code. For details refer to AUTOSAR_SWS_RTE.pdf. Apart from this, the file structure is not standardized, and therefore represented as one single artifact in the methodology. In general, the RTE code can be partitioned in several files. The partitioning depends on the RTE vendor's software design and generation strategy. Nevertheless it shall be possible to clearly identify code and header files which are part of the RTE module.		
Kind	Code		
Relation Type	***Related Element***	***Mul.***	***Note***
ProducedBy	Generate RTE	1	
ConsumedBy	Compile ECU Source Code	1	

Table 3.246: RTE Source Code

3.6.2.16 BSW Scheduler Code

Artifact	**BSW Scheduler Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Generated Code implementing the BSW Scheduler.		
Description	Generated Code implementing the BSW Scheduler. It can be source or macro code.		
Kind	Code

Table 3.247: BSW Scheduler Code

3.6.2.17 OS Generated Code

Artifact	**OS Generated Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	OS configuration generated code		
Description	OS configuration generated code. OS configuration code are composed of header and C files. These will be compiled with the source code in the build process (see Compile Source Code).		
Kind	Code		
Relation Type	**Related Element**	**Mul.**	**Note**
ProducedBy	Generate OS	1	
ConsumedBy	Compile ECU Source Code	1	

Table 3.248: OS Generated Code

3.6.2.18 RTE Postbuild Variants Dataset

Artifact	**RTE Postbuild Variants Dataset**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::Work Products		
Brief Description	Generated code used to resolve postbuild variants in the RTE.		
Description	Generated code used to resolve postbuild variants in the RTE. It consists of a c-file and a header file: • The RTE generator must generate a Rte_PBCfg.c file containing the declarations and initializations of one or more RTE post build variants. Only one of these variants can be active at runtime. • The RTE generator shall generate in the Rte_PBCfg.h file the SchM_ConfigType type declaration of the predefined post build variants data structure. This header file must be used by other RTE modules to resolve their runtime variabilities. Generation of the executable for Postbuild Configuration Data is not modeled here.		
Kind	Code		
Relation Type	**Related Element**	**Mul.**	**Note**
ProducedBy	Generate RTE Postbuild Dataset	1

3.6.4.1.5 Generate BSW Precompile Configuration Header

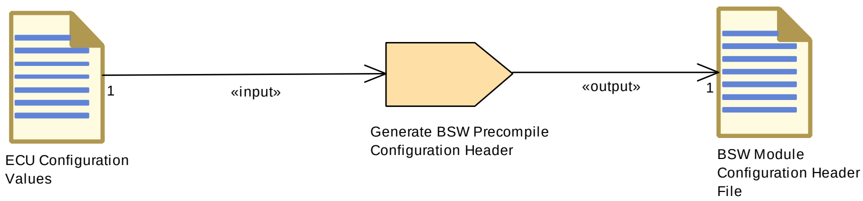

Figure 3.129: Generate BSW Precompile Configuration Header

Task Definition	**Generate BSW Precompile Configuration Header**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate BSW Precompile Configuration Header		
Description	Generate BSW Pre-compile Configuration Header. The header is used for definition or declaration (in case source code is needed) of the pre-compile configuration data code.Only Configuration header is generated		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	ECU Configuration Values	1	
Produces	BSW Module Configuration Header File	1	

Table 3.262: Generate BSW Precompile Configuration Header

3.6.4.1.6 Generate BSW Source Code

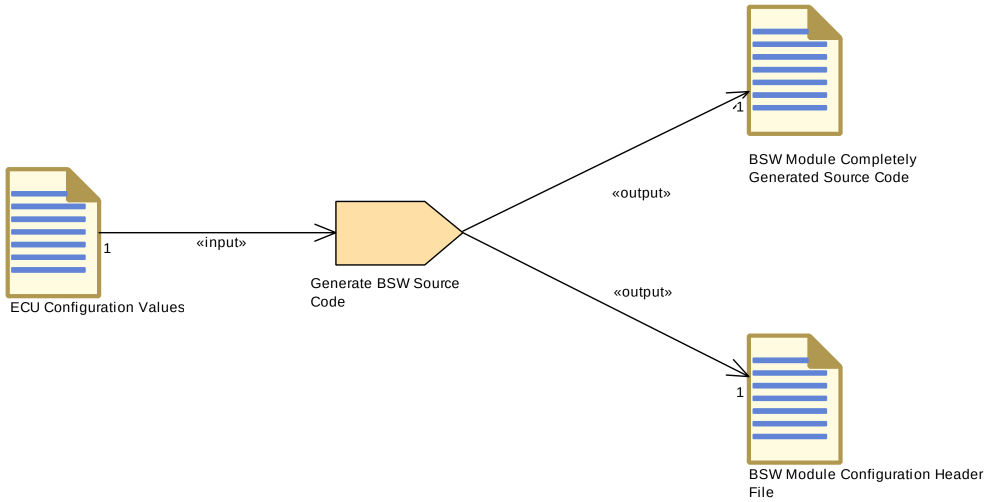

Figure 3.130: Generate BSW Source Code

Task Definition	**Generate BSW Source Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate the source code of a module completely from its precompile configuration.		
Description	Generate the source code of a BSW module completely from its pre-compile configuration. A header file may be produced in addition, if required.Source code is completely generated		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	ECU Configuration Values	1	
Produces	BSW Module Completely Generated Source Code	1	
Produces	BSW Module Configuration Header File	1	

Table 3.263: Generate BSW Source Code

3.6.4.1.7 Generate BSW Configuration Code

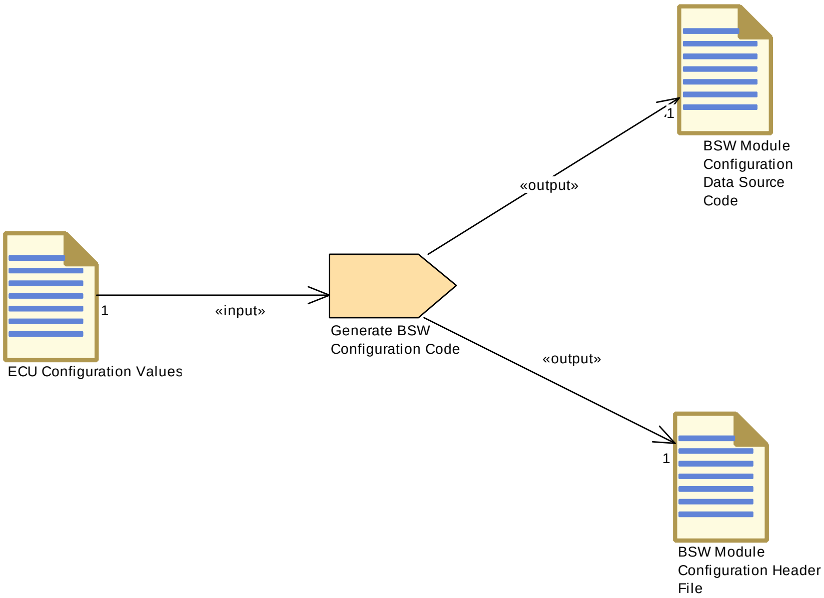

Figure 3.131: Generate BSW Configuration Code

Task Definition	**Generate BSW Configuration Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate source code which implements configuration data for link- or compile-time configuration.		
Description	A generator reads the relevant parameters from the ECU Configuration Description and creates a separate code file that implements the specified configuration. This task is used for link-time configuration, i.e. the configuration code can be produced at link-time of the core code or for compile-time configuration, if the configuration code cannot be put into a header file (e.g. for tables), even if the core code and the configuration code shall be compiled at the same time. A header file may be produced in addition, to declare the data. Furthermore the generator may produce extensions of the BSW module description artifacts as a result of configuration parameter values which are set at integration time.		
Relation Type	***Related Element***	***Mul.***	***Note***
Performer	ECU Integrator	1	
Consumes	ECU Configuration Values	1	
Consumes	BSW Module Generator	0..1	This is an input in case a generator framework is used which has to run some module specific generator code.
Consumes	BSW Module Vendor-Specific Configuration Parameter Definition	0..*	

Relation Type	***Related Element***	***Mul.***	***Note***
Produces	BSW Module Configuration Data Source Code	1	
Produces	BSW Module Configuration Header File	1	
Produces	BSW Module Behavior Extension	0..1	
Produces	BSW Module Implementation Extension	0..1	
Produces	BSW Module Interface Extension	0..1	
UsedTool	BSW Generator Framework	1

3.6.4.1.8 Generate BSW Configuration Data Loadable

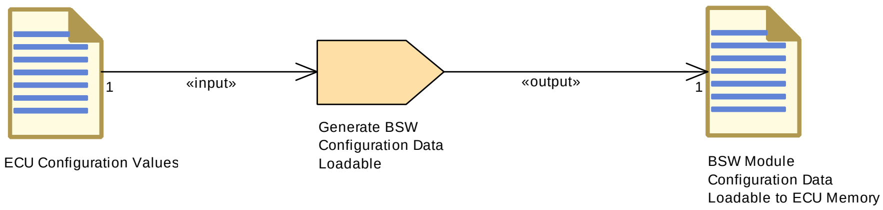

Figure 3.132: Generate BSW Configuration Data Loadable

Task Definition	**Generate BSW Configuration Data Loadable**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate a postbuild-loadable set of data for the configuration of a BSW module.		
Description	Generate a postbuild-loadable set of data for the configuration of a BSW module. Approach 2: Generate loadable data		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	ECU Configuration Values	1	
Produces	BSW Module Configuration Data Loadable to ECU Memory	1	

Table 3.265: Generate BSW Configuration Data Loadable

3.6.4.1.9 Generate BSW Postbuild Configuration Code

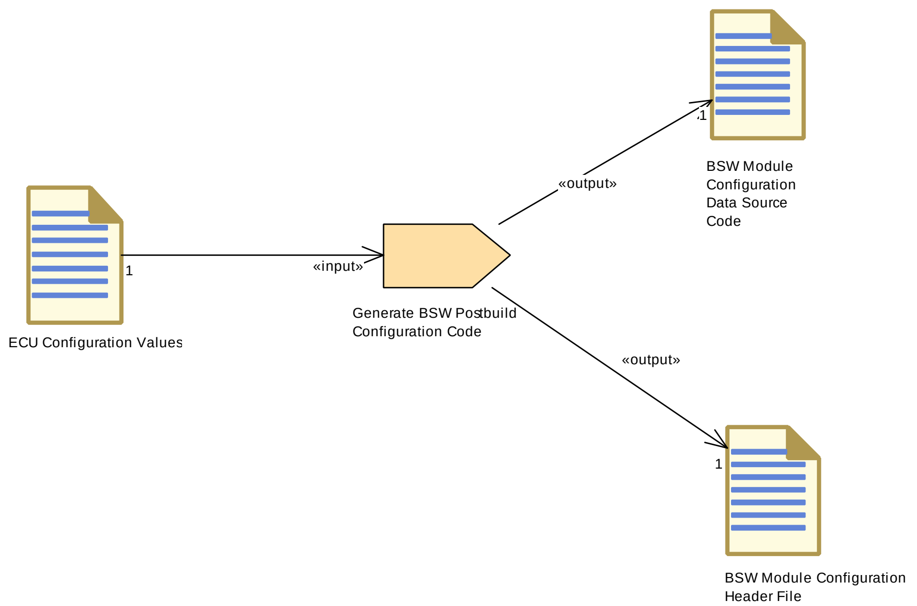

Figure 3.133: Generate BSW Postbuild Configuration Code

Task Definition	**Generate BSW Postbuild Configuration Code**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Generate the code for data structures that can be used for postbuild configuration.		
Description	Generate the source code and associated header for data structures that can be used for selectable or loadable postbuild configuration.Approach 1: Generate C code		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	ECU Configuration Values	1	
Produces	BSW Module Configuration Data Source Code	1	
Produces	BSW Module Configuration Header File	1	

Table 3.266: Generate BSW Postbuild Configuration Code

3.6.4.1.10 Link ECU after Precompile Configuration

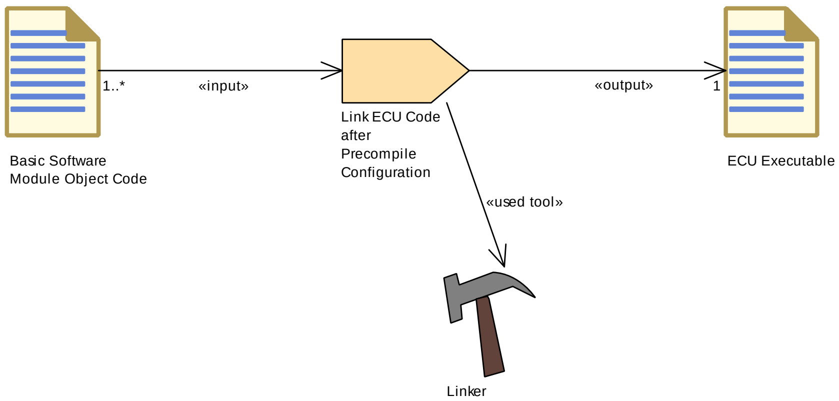

Figure 3.134: Link ECU after Precompile Configuration

Task Definition	**Link ECU Code after Precompile Configuration**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Link the ECU code in the pre-compile time Configuration Class		
Description	Link the different BSW modules object code in the pre-compile Configuration Class. All parameters values for configurable elements have been already fixed and are effective after compilation time.		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	Basic Software Module Object Code	1..*	
Produces	ECU Executable	1	
UsedTool	Linker	1

Task Definition	**Link ECU Code during Post-build Time Selectable**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Link ECU Code during Post-build Time Selectable		
Description	Link ECU Code during the Post-build Time Selectable allowing the definition, during boot time of a configuration set upon multiple ones.		
Relation Type	***Related Element***	***Mul.***	***Note***
Consumes	Basic Software Module Object Code	1..*	
Consumes	BSW Module Configuration Data Object Code	0..*	
Produces	ECU Executable	1	
UsedTool	Linker	1	

Table 3.269: Link ECU Code during Post-build Time Selectable

3.6.4.1.13 Link ECU Code During Post-build Time Loadable

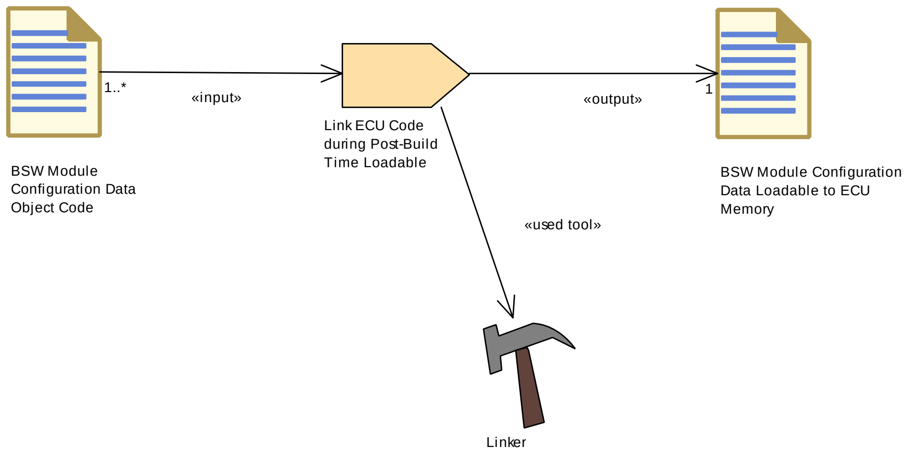

Figure 3.137: Link ECU Code During Post-build Time Loadable

Task Definition	**Link ECU Code during Post-Build Time Loadable**		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Tasks		
Brief Description	Link ECU Code during post-build time loadable .		
Description	Link ECU Code during post-build time loadable . The objects used for this link are coming from configuration data file that contain all configured parameters. The result of the link is a hex file that will be loadable in the ECU memory.		
Relation Type	**_Related Element_**	**_Mul._**	**_Note_**
Consumes	BSW Module Configuration Data Object Code	1..*	
Produces	BSW Module Configuration Data Loadable to ECU Memory	1	
UsedTool	Linker	1

3.6.4.2 Work Products

3.6.4.2.1 BSW Module Configuration Header File

Artifact	BSW Module Configuration Header File		
Package	AUTOSAR Root::M2::Methodology::Methodology Library::Ecu::ECU Config Classes::Work Products		
Brief Description	C-header file generated from the configuration data of a BSW module.		
Description	C-header file generated from the configuration data of a BSW module, defining the data (only possible for pre-compile configuration) or containing additional declarations (needed by generated configuration code only).		
Kind	Code		
Relation Type	**Related Element**	**Mul.**	**Note**
ProducedBy	Generate BSW Configuration Code	1	
ProducedBy	Generate BSW Postbuild Configuration Code	1	
ProducedBy	Generate BSW Precompile Configuration Header	1	
ProducedBy	Generate BSW Source Code	1	
ConsumedBy	Compile BSW Configuration Data	1	
ConsumedBy	Compile Configured BSW	1	
ConsumedBy	Compile Generated BSW	1	
ConsumedBy	Compile ECU Source Code	0..*
